Owen Barfield

Erich Auerbach. Scenes from the Drama of European Literature: Six Essays (notably the long opening chapter headed "Figura"). Magnolia, Massachusetts: Peter Smith, 1973.

A Note

In all of the above, and no doubt in a number of others which unfortunately do not now come to mind, I seem to myself to have detected a move, or a speculative tendency to move on from history of ideas into evolution of consciousness. I must add what I have already made clear in most of my own books (whereof a list of those in print will be found at the beginning of this book), that for a full treatment of the subject, both extensive and intensive, clearly based on actual knowledge of it, I have found nowhere to go outside the works of Rudolf Steiner.

PREFACE

Readers of this book may possibly be assisted by a few brief remarks on its form. This is, or was intended to be, broadly speaking, a progress from phenomena to general principles, and from those general principles back again to phenomena. The initial phenomena are the author's own aesthetic and psychological experiences; while those, to which the general principles induced from these are subsequently applied, are various problems of literature and especially of 'poetic diction' in its narrower sense. The 'general principles', however, for reasons explained in the book itself, take the form rather of pictures and metaphors than of propositions. Moreover, owing to their flat discrepancy from many opinions which are very commonly regarded—not on aesthetic grounds—as definitely established, much more time has been spent in developing and defending them than would ordinarily have been necessary in a short work on Poetic Diction.

I may perhaps be allowed to add that this
progress is not simply adopted artificially, for the purpose of appearing scientific, but is, roughly, an autobiographical record of the manner in which the author arrived at the general principles in question; for when he first began to enjoy poetry, he really had no beliefs about it or general principles of interpretation at all. An early perception that poetry reacts on the meanings of the words it employs was followed by a dim, yet apodeictically certain, conviction that there are 'two sorts of poetry'; and a series of unsuccessful attempts to rationalize these and other aesthetic experiences in terms of the various theories of language, literature, and life, with which the author happened to come in touch, resulted in the present volume.

Having concluded it, I am confronted with a problem which many Europeans, I fancy, are likely to have to face, as time passes—that of defining the precise nature of the debt owed by the book to the late Dr. Rudolf Steiner. Begun as an academic exercise a good many years ago, it was subsequently dropped, and it was in the interval that I came across Steiner's work. And now I am in difficulties. For, while the references and quotations in the

Appendices must convey an absurdly inadequate sense of what this meant, yet it would, it seems, be impossible in a Preface to convey half my own sense of indebtedness without appearing, quite improperly, to father upon him many of the views on poetry which I have expressed—whereas I can scarcely recollect anything he has said or written on that subject at all, nor am I yet acquainted with his lectures on Language. I may possibly be excused, therefore, for abandoning the problem altogether. In any case, only those who are themselves more than superficially acquainted with Steiner's work would be able to gauge the inestimable advantage of being even partly in touch with it, to anyone engaged on either the theory or the practice of any art.

The appearance of Spengler's Decline of the West, a profound and alarmingly learned study of the historical—as opposed to the literary—relation between prosaic and poetic, which occurred just after this book was completed in its original academic form, interested me so much that, in revising it for the press, I have added two or three allusions.

Finally, I would ask those who may object to the theory of poetry developed here, that it
takes no account of feeling, to recollect that the kind of inspired thinking which I have attempted to depict, assumes the utmost intensity of feeling as a necessary pre-requisite. There could be no other way of reaching it. It can only begin when feeling has become too powerful to remain only personal, so that the individual is compelled by his human nature, either to think in reality, or to find, more or less instinctively, some suitable device for dimming his consciousness.

O. B.
DEFINITION AND EXAMPLES

When words are selected and arranged in such a way that their meaning either arouses, or is obviously intended to arouse, aesthetic imagination, the result may be described as poetic diction. Imagination is recognizable as aesthetic, when it produces pleasure merely by its proper activity. Meaning includes the whole content of a word, or group of words, other than the actual sounds of which they are composed. Thus, this book is concerned with a realm of human experience in which such an expression as ‘prophets old’ may, and probably will, ‘mean’ something quite different from ‘old prophets’.

If the question, what is poetry? has never been answered, everyone will agree at least thus far: that it is not merely so many waves in the air or ink-marks on a piece of paper—that it exists primarily in the world of con-

[13]
POETIC DICTION

sciousness. Language itself, we feel, only springs into being as it is uttered by men, or heard by men, or thought by men. Whatever poetry may be, then, it is something more than the signs or sounds by which it is conveyed.

So decisive is this rule that the same sounds and signs may easily be vehicles of poetry at this place and not in that, at this time and not at that, to this person and not to the other. To the author of the famous article in Blackwood's, none of the sounds and signs composing Endymion were a vehicle of poetry. To the writer of this book the introductory section of Browning's Ring and the Book is not a vehicle of poetry. To John Robinson of Bethnal Green Paradise Lost is not a vehicle of poetry. This is elementary. But what I wish to emphasize is that, while we can blame or commiserate these individuals, as we choose, for not maintaining or cultivating, or for not having had the opportunity to cultivate and maintain, the requisite sensibility, it is, strictly speaking, meaningless—unless by way of a forcible hyperbole—to accuse them of mistaking something that is poetry for something that is not. The question of whether or no I can call a given group of words 'poetry' is, in fact,

DEFINITION AND EXAMPLES

immediately dependent on my own inner experiences; and in constructing a theory of poetic diction, it is from those experiences that I am obliged to start.

In view, however, of the predominantly personal direction taken by literary criticism during the last few decades, it may be well to point out here that to start from personal experience does not necessarily mean to finish with it. One may start from direct, personal, aesthetic experience without prejudice to the possibility of arriving in the end at some objective standards of criticism—standards which a young critic might set before himself as an aid to the elimination of just those personal affections and associations—the accidents rather than the substance of poetry—which are always at hand to distort his judgment.

EXAMPLES

I

Thrice-piecee bamboo, two-piecee puff-puff, walk-along-inside, no-can-see.

II

Up then crew the red, red cock,
And up and crew the grey;
The eldest to the youngest said,
'Tis time we were away.'
POETIC DICTION

The cock he hadn'd crawl'd but once,
   And clapped his wings at a;
When the eldest to the youngest said,
   'Brother, we must awa.'
'The cock doth craw, the day doth daw,
   The channerin' worm doth chide;
Gin we be miss'd out o' our place,
   A sair pain we maun bide.'

III

Love is a sickness full of woes,
   All remedies refusing;
A plant that with most cutting grows,
   Most barren with best using.
   Why so?
More we enjoy it, more it dies;
If not enjoy'd, it sighing cries—
   Heigh ho!

Love is a torment of the mind,
   A tempest everlasting;
And Jove hath made it of a kind
Not well, nor full nor fasting.
   Why so?
More we enjoy it, more it dies;
If not enjoy'd, it sighing cries—
   Heigh ho!

IV

The inferior priestess, at her altar's side,
   Trembling, begins the sacred rites of pride.
Unnumbered treasures ope at once, and here
The various offerings of the world appear;

DEFINITION AND EXAMPLES

From each she nicely culls with curious toil,
   And decks the goddess with the glittering spoil.
This casket India's glowing gems unlocks,
   And all Arabia breathes from yonder box.
The tortoise here and elephant unite,
   Transform'd to combs, the speckled and the white.
Here files of pins extend their shining rows,
Puffs, powders, patches, Bibles, billets-doux.
Now awful Beauty puts on all its arms;
The fair each moment rises in her charms,
Repairs her smiles, awakens every grace,
   And calls forth all the wonders of her face;
Sees by degrees a purer blush arise,
   And keener lightnings quicken in her eyes.
The busy sylphs surround their darling care:
These set the head, and those divide the hair;
Some fold the sleeve, whilst others plait the gown;
   And Betty's praised for labours not her own.

v (a)

My soul is an enchanted boat,
   Which, like a sleeping swan, doth float
   Upon the silver waves of thy sweet singing;
And thine doth like an angel sit
   Beside a helm conducting it,
Whilst all the winds with melody are ringing . . .

v (b)

What is your substance, whereof are you made,
   That millions of strange shadows on you tend?
Since every one hath, every one, one shade,
   And you, but one, can every shadow lend . . .
POETIC DICTION

Behold now this vast city, a city of refuge, the mansion-house of liberty, encompassed and surrounded with his protection; the shop of war hath not there more anvils and hammers waking, to fashion out the plates and instruments of armed justice in defence of beleaguered truth, than there be pens and heads there, sitting by their studious lamps, musing, searching, revolving new notions and ideas where-with to present, as with their homage and their fealty, the approaching Reformation; others as fast reading, trying all things, assenting to the force of reason and conviction.

What could a man require more from a nation so pliant and so prone to seek after knowledge? What wants there to such a towering and pregnant soil, but wise and faithful labourers, to make a knowing people, a nation of prophets, of sages, and of worthies? We reckon more than five months yet to harvest; there need not be five weeks; had we but eyes to lift up, the fields are white already.

I have transcribed above six separate groups of English words, all of which have been proved capable, in one case, of arousing aesthetic imagination. To begin with, I shall ignore the difference between the sensations which the various examples are able to arouse, in an attempt to fix any elements which they have in common. The first example is Pidgin English for a three-masted screw steamer with two funnels. I have added it to the rest, in the first place, because it appears to me to be indisputable that such primitive and semi-

DEFINITION AND EXAMPLES

foreign expressions often have value as poetic diction, and, in the second place, because, that being so, their very baldness is a great advantage. Detached from all historical associations and poetic tradition, and yet affecting us in a manner which is qualitatively the same as that of explicitly 'poetic' diction, they present, as it were, the lowest common measure of our subject.
THE EFFECTS OF POETRY

II

PLEASURE AND KNOWLEDGE

1. In examples II to VI one of the most efficient causes of pleasure is—palpably—sound; the rhythm, the music, and the manner in which rhythm and music are wedded to sense. This fact, however, will not be further discussed; for, although, in so far as it is effective, music becomes a part of 'meaning', yet I consider it as lying outside the province of poetic diction, properly so called.

2. When I try to describe in more detail than by the phrase 'esthetic imagination' what experience it is to which at some time or other I have been led, and at any time may be led again, by all of these examples, I find myself obliged to define it as a 'felt change of consciousness', where 'consciousness' embraces all my awareness of my surroundings at any given moment, and 'surroundings' includes my own feelings. By 'felt' I mean to signify that the change itself is noticed, or attended to. To take the simplest example: No. 1—when I, as European adult, actually observe or visualize a three-masted screw steamer with two funnels, the manner in which I immediately experience my surroundings, the meaning which they have for me, is determined by the various concepts which I have learnt, since my childhood, to unite with the percept, or complex of percepts, underlying the phenomenon in question. By 'percept' I mean that element in my experience, which in no way depends on my own mental activity, present or past—the pure sense-datum. The concepts likely to be operative in this case are reflected in such English words as 'mast', 'mechanical propulsion', 'steam', 'coal', 'smoke', 'chimney for smoke to escape by', etc., all of which are summed up and, as it were, fused in my own peculiar and habitual idea of 'steamer'. It is this idea which determines for me the quality, or meaning, of my immediate experience in observation.

Now when I read the words 'three-piecee bamboo, two-piecee puff-puff, walk-along-inside, no-can-see', I am for a moment transported into a totally different kind of consciousness. I see the steamer, not through my own
POETIC DICTION

eyes, but through the eyes of a primitive South-Sea Islander. His experience, his meaning, is quite different from mine, for it is the product of quite different concepts. This he reveals by his choice of words; and the result is that, for a moment, I shed Western civilization like an old garment and behold my steamer in a new and strange light.

3. Without reducing our definition of poetic diction to an absurdity, we can hardly maintain that this particular example (No. 1) would be 'poetic' to the South-Sea Islanders themselves. On the contrary, we may safely suppose it to be felt there as a part of the business jargon of every day. It is thus a particularly clear-cut example of the fact, referred to in Chapter I, that a given group of words may be a vehicle of poetry to one individual, or group of individuals, and not to another. It may, for instance, be unpoetic to the consciousness which originates it, but poetic to the consciousness which receives or contemplates it. This is an aspect of poetic diction to which I shall have to return later.

From this it follows that the extent to which

Footnotes:

1 Pidgin is in fact said to be the Chinese version of the English word 'business'.

THE EFFECTS OF POETRY

the selection and arrangement of words is due to a consciously creative effort ('art') on the part of some one human being ('poet') varies as between the six examples. The range of variation must probably remain a matter of dispute; but it would be at any rate arguable that it is from nought in the first example up to eighty or ninety per cent. in the last two. Obviously this percentage can never rise to a hundred, because even the most original poet is obliged to work with words, and words, unlike marble or pigment or vibrations in the air, owe their very substance ('meaning') to the generations of human beings who have previously used them. No poet, therefore, can be the creator of all the meaning in his poem.

The point will be made plainer by taking an intermediate example. Consider No. II. There is no need to enter into the old question of the communal origin of ballads; for however pronounced may be the stamp of individual genius in the best English ballads, it still remains indisputable that they have in common certain turns of expression, certain tricks of metre and repetition and narrative; and that, while on the one hand these cannot all be due to the genius of one single man, on the other hand...
POETIC DICTION

hand, they do undoubtedly contribute to the poetic quality of the diction of the ballad. Thus, if I wish to be especially critical, I can divide my enjoyment of a ballad into two parts: I enjoy it as ballad, and I enjoy it as poem. This fact comes out very clearly if I read a great number of ballads one after the other. For then, in time, the ‘ballad’ quality ceases to arouse my aesthetic imagination at all, and I depend wholly on the individual quality of the one particular example I am reading at the moment.

So, too, in the lyric from Campion (No. III):—part of my aesthetic experience I owe to the individual genius of the poet Campion. Part, on the other hand—and I believe anyone who seriously examines his feelings will reach the same conclusion—is due to something which I will call its ‘Elizabethan-ness’. Needless to say, the phenomenon is not peculiar to the Elizabethan lyric. It is true of other times and places, of the poetry of the Greek Anthology, for example, of the French Pléiade, of the English Metaphysicals, or the Cavalier lyric, and it has been well named by some critic ‘joint-stock poetry’. It arises wherever different poets work together in a kind of coterie or

THE EFFECTS OF POETRY

come under the same contemporary influences; in the lyric it is brought out especially strongly when we hear the words set to the music of contemporary composers. And it is always true that if I read or hear too much, if I saturate my imagination with poetry of the same genre, I lose my power to appreciate it at genre, and am thrown back on the achievement, such as it may be, of the individual poet.

In such cases, then, we distinguish two separate causes of poetic pleasure; and we are enabled to do this because the realization and contemplation of this ‘joint-stock’ element is itself a third pleasure. It might be compared with the delight which Chaucer took in contemplating ‘the law of kind’. Further, our enjoyment of this ‘joint-stock’ element is something in which the producers of the diction in question can have had no share. This was a part of their work, of which they were unconscious, for they were actually living it.

4. Thus, an introspective analysis of my experience obliges me to say that appreciation of poetry involves a ‘felt change of consciousness’. The phrase must be taken with some exactness. Appreciation takes place at the actual moment of change. It is not simply
POETIC DICTION

that the poet enables me to see with his eyes, and so to apprehend a larger and fuller world. He may indeed do this, as we shall see later; but the actual moment of the pleasure of appreciation depends upon something rarer and more transitory. It depends on the change itself.

If I pass a coil of wire between the poles of a magnet, I generate in it an electric current—but I only do so while the coil is positively moving across the lines of force. I may leave the coil at rest between the two poles and in such a position that it is thoroughly permeated by the magnetic field; but in that case no current will flow along the conductor. Current only flows when I am actually bringing the coil in or taking it away again. So it is with the poetic mood, which, like the dreams to which it has so often been compared, is kindled by the passage from one plane of consciousness to another. It lives during that moment of transition and then dies, and if it is to be repeated, some means must be found of renewing the transition itself.

Poetry, as a possession, as our own souls enriched, is another matter. But when it has entered as deeply as that into our being, we no longer concern ourselves with its diction.

THE EFFECTS OF POETRY

At this stage the diction has served its end and may be forgotten. For, if ever we go back to linger lovingly over the exquisite phrasing of some fragment of poesy whose essence has long been our own, and of which the spirit has become a part of our every waking moment, if we do this, is it not for the very reason that we want to renew the thrill which accompanied the first acquisition of the treasure? As our lips murmur the well-known—or it may be the long-forgotten—words, we are trying, whether deliberately or no, to cast ourselves back into the frame of mind which was ours before we had learnt the lesson. Why? Because we know instinctively that, if we are to feel pleasure, we must have change. Everlasting day can no more freshen the earth with dew than everlasting night, but the change from night to day and from day back again to night.

That we are not always successful in the wistful quest is matter of only too common experience. Mr. Santayana has expressed with great beauty this sometimes overlooked fact of the rareness of real aesthetic experience:

'Men are habitually insensible to beauty.

[26]

[27]
POETIC DICTION

Tomes of aesthetic criticism hang on a few moments of real delight and intuition. It is in rare and scattered instants that beauty smiles even on her adorers, who are reduced for habitual comfort to remembering her past favours. An aesthetic glow may pervade experience, but that circumstance is seldom remarked; it figures only as an influence working subterraneously on thoughts and judgments which in themselves take a cognitive or practical direction. Only when the aesthetic ingredient becomes predominant do we exclaim, How beautiful! Ordinarily the pleasures which formal perception gives remain an undistinguished part of our comfort or curiosity.

Taste is formed in those moments when aesthetic emotion is massive and distinct; preferences then grow conscious, judgments then put into words will reverberate through calmer hours; they will constitute prejudices, habits of apperception, secret standards for all other beauties. A period of life in which such intuitions have been frequent may amass tastes and ideals sufficient for the rest of our days. Youth in these matters governs maturity, and while men may develop their early impressions more systematically and find confirmations of

THE EFFECTS OF POETRY

them in various quarters, they will seldom look at the world afresh or use new categories in deciphering it. Half our standards come from our first masters, and the other half from our first loves. Never being so deeply stirred again, we remain persuaded that no objects save those we then discovered can have a true sublimity.

. . . Thus the volume and intensity of some appreciations, especially when nothing of the kind has preceded, makes them authoritative over our subsequent judgments. On those warm moments hang all our cold systematic opinions; and while the latter fill our days and shape our careers it is only the former that are crucial and alive.

Is there anybody so fortunate as to be able to dispute the truth in this passage? Yet that precarious element in poetry, which has puzzled critics and poets alike, may at any rate become clearer to us, may even come a little more under our control, if once we can elucidate its causes. And to me the principal cause appears to be that poetic experience depends on a 'difference of potential', a kind of discrepancy between two moods or modes of consciousness. It is from this point, I take it, that a profitable
POETIC DICTION

study of the psychology of aesthetics would diverge.

5. At the end of the last section a distinction was drawn between poetry as the cause of immediate pleasure (the subject of the three preceding sections) and 'poetry as a possession'. What, then, is meant by poetry as a possession? To some extent in all the examples, but especially in No. V, I am impressed not merely by the difference between my consciousness and the consciousness of which they are the expression, but by something more. I find that, in addition to the moment or moments of aesthetic pleasure in appreciation, I gain from them a more permanent boon. It is as though my own consciousness had actually been expanded. In V(a), for example, the image contains so much truth and beauty that henceforth the eyes with which I behold real boats and waves and swans, the ears with which in the right mood I listen to a song, are actually somewhat different.

Now my normal everyday experience, as human being, of the world around me depends entirely on what I bring to the sense-datum from within; and the absorption of this metaphor into my imagination has enabled me to understand world through an understanding of sense datum.

THE EFFECTS OF POETRY

bring more than I could before. It has created something in me, a faculty or a part of a faculty, enabling me to observe what I could not hitherto observe. This ability to recognize significant resemblances and analogies, considered as in action, I shall call knowledge; considered as a state, and apart from the effort by which it is imparted and acquired, I shall call it wisdom. The elements in poetic diction which most conduce to it are, as we shall see, metaphor and simile. The use of the word 'significant' will be justified in due course.

A little reflection shows that all meaning— even of the most primitive kind—is dependent on the possession of some measure of this power. Where it was wholly absent, the entire phenomenal cosmos must be extinguished. All sounds would fuse into one meaningless roar, all sights into one chaotic panorama, amid which no individual objects—not even colour itself—would be distinguishable. Let the reader imagine for a moment that he is standing in the midst of a normal and familiar environment—houses, trees, grass, sky, etc.—when, suddenly, he is deprived by some supernatural stroke of every vestige of memory—and not
POETIC DICTION

only of memory, but also of all those assimilated, forgotten experiences, which comprise his power of recognition. He is asked to assume that, in spite of this, he still retains the full measure of his cognitive faculty as an adult. It will appear, I think, that for the first few moments his consciousness—if it can bear that name—will be deprived not merely of all thought, but even of all perception, as we ordinarily understand the word¹—unless we choose to suppose a certain unimaginable minimum, a kind of panorama of various light, which he will confront with a vacant and uncomprehending stare. It is not merely that he will be unable to realize that that square, red and white object is a 'house', and to form concepts of an inside with walls and ceilings—he will not even be able to see it as a square, red and white object. For the most elementary distinctions of form and colour are only apprehended by us with the help of the concepts which we have come to unite with the pure sense-datum. And these concepts we acquire and fix, as we grow up, with the help of

¹ Here, however, called observation, perception being reserved for that element in our 'reading' of the world, which is entirely independent of the understanding.

THE EFFECTS OF POETRY

words—such words as square, red, etc. On the basis of past perceptions, using language as a kind of storehouse,² we gradually build up our ideas, and it is only these (cf. II, 2) which enable us to become 'conscious', as human beings, of the world around us. There is, therefore, nothing pretentious or dilettante in describing my experience as 'an expansion of consciousness'.

6. While this expansion (knowledge) may remain as something of a permanent possession (wisdom), my aesthetic pleasure will still, in the case under review, only accompany the actual moment of expansion, as it before accompanied the moment of change. In fact, as far as the possibility of aesthetic pleasure is concerned, expansion is merely one particular form taken by the necessary change, or movement; and if I wish to repeat the pleasure, I am obliged, as was pointed out (§ 4), to throw myself back into the imaginative content which was mine

² The exact relations of cause and effect between language and thought need not be discussed. Nor need we at present consider whether the two are indeed absolutely inseparable, as e.g. Locke and Max Müller held. It is enough that for the communication of thought, and of the feelings which thoughts can arouse, and for the storing and public record of them, language is, in fact, the common medium.
POETIC DICTION

before I had made these metaphors a part of my meaning of life.

To trace out this alternating basis of the poetic mood into further detail, and to strip it of some of its obscurity, it will be necessary to consider first of all the nature and history of language itself. Incidentally, this is quite in accord with the traditions of the subject. Dante felt obliged to write at length on the subject of language. And if he, like the Frenchman Du Bellay after him, still regarded it rather from a national point of view, Wordsworth and Shelley showed, in a later age, how a proper study of poetic diction is inseparable from the study of language as a whole.

'In the infancy of society [wrote Shelley] every author is necessarily a poet, because language itself is poetry... Every original language near to its source is itself the chaos of a cyclic poem.'

And Wordsworth insisted that the subject 'could not be determined without pointing out in what manner language and the human mind act and react on each other, and without

THE EFFECTS OF POETRY

retracing the revolutions, not of literature alone, but likewise of society itself.'

'Poetry', said Coleridge, 'is the best words in the best order'; in other words, it is 'the best language'. By considering it as such, I hope to mark out a sheet on which it would be possible to plot, to some purpose, the lesser vagaries of English versification. Without some such ground-plan all criticism, all theorizing on the problems of poetic diction, all speculation as to what was or was not beautiful or justifiable in the poetry of the past, and, above all, all attempts to apply such theories to the poetry of the present, must peter out in expressions of personal taste. If my inclination is to scepticism and polite society, I shall exalt Pope and Racine at the expense of Dante and Shelley; if to natural scenery and creative evolution, I shall praise Wordsworth and spit upon Waller. It does not seem unduly arrogant to suggest that criticism is tired of this cat and dog business and needs a little fresh air.

1 Appendix on the phrase 'Poetic Diction'.

A Defence of Poetry.
III

METAPHOR

1. In the West, since Plato's time, the study of language has been developed mainly by grammarians and logicians. It is true that about a hundred and fifty years ago a more historical conception of philology suddenly began to spread rapidly over Europe. But the emphasis was still, until recently, on the external forms of words. The result is, as far as I am aware, that no really profound study has yet been made of meaning—that is to say, of the meanings of individual words. This subject—Semantics, as it is now commonly called—makes its first, embryonic appearance as a cautionary chapter following the chapter on Terms in a logical textbook, and it is not until long after that it acquires a separate existence, and even a hint of wings, in the work of writers like Archbishop Trench, Max Müller, and, to-day, Mr. Pearsall Smith.

The extraordinarily intimate connection between language and thought (the Greek word λόγος combined, as we should say, both meanings) might lead one to expect that the philosophers at least would have turned their attention to the subject long ago. And so, indeed, they did, but with a curiously disproportionate amount of interest. The cause of this deficiency is, I think, to be found in the fact that Western philosophy, from Aristotle onwards, is itself a kind of offspring of Logic.

To anyone attempting to construct a metaphysic in strict accordance with the canons and categories of formal Logic, the fact that the meanings of words change, not only from age to age, but from context to context, is certainly interesting; but it is interesting solely because it is a nuisance.

I will try to make this clearer by a comparison. The financial mysteries of 'inflation' and 'deflation' may likewise be said to 'interest' the practising merchant. But that interest is, for the most part, of a limited sort. Since money is the very basis of all his operations; he has, I think it can be said, an instinctive distaste for the mere possibility that money-units themselves should be found to have only an arbitrary 'subjective' value—that they should
POETIC DICTION

prove to be simply cross-sections of an endless process taking place in time. If that is true, all is lost. The dykes are opened. Like magic, he sees shrewd practical maxims turning into rarified academic theories, and a comparatively simple and intelligible system of acknowledged facts ('the economic verities') having to be rigged with all sorts of super-subtle reservations and ceteris paribus's, before it will bear the faintest relation to contemporary realities.

What money is to the conservative economist, words are to the conservative philosopher. For the conception of money as a 'symbol of barter' and the conception of words as the 'names of things' are, both alike, not so much untrue as 'out of date'; and for the same reason: not because the advance of science has revealed avoidable ancient errors, but because the facts themselves have changed. Once upon a time money really was an immediate substitute for barter, and once upon a time words could really be the expression on the face of concrete reality. Error—or, at best, waste of energy—is in both cases the fruit of unwillingness to recognize essential change. The spell of the immediate past proves too strong; and, just as the stubborn economist,

METAPHOR

with his eyes fixed on that past, turns his back on all new-fangled nonsense and nails his colours stoutly to the mast of stabilization, so the philosopher waves aside the study of meaning and still maintains a desperate faith in the ancient system of definitions. In both instances, it may be that somewhere—deep down in the unconscious—a voice has cried Lass mich schlafen!

Whatever the cause, nearly all that has hitherto been said on the semantic aspect of language has been said from one point of view only. And from that point of view it has been said wonderfully well. The original twist was given by the Father of Logic himself, when he included in his Organon a brief treatise De Interpretatione, and since then the conception of language as the prime material of logical constructions has been developed many times with infinite delicacy. It is difficult, for example, to praise too highly the limpid clarity of the third book of Locke's Essay on the Human Understanding; and even as recently as the last century Mr. Bosanquet found memorable things to say in the opening chapters of his Logic. Doubtless other modern philosophers have done as well, or better.

[38]

[39]
POETIC DICTION

We have had, then, to the full, language as it is grasped by logical mind. What we have not had—or what we have only had in hints and flashes—is language as it is grasped by poetic mind. The fundamental difference between logical and poetic mind (which has very little to do with the fashionable contrast between Poetry and Science) will appear farther in the course of this book, wherein I have myself attempted to sketch the way in which a poetic understanding would approach the problem. I have, however, made no attempt to write what I should so much like to see written—a true, poetic history and philosophy of language. On the contrary, it has been my object to avoid (except perhaps in two of the Appendices) entering deeper into the nature of language than is absolutely necessary, in order to throw on ‘Poetry’, in the usual literary sense of that word, the kind of light which, I think, needs to be thrown.

2. The most conspicuous point of contact between meaning and poetry is metaphor. For one of the first things that a student of etymology—even quite an amateur student—discovers for himself is that every modern language, with its thousands of abstract terms and its nuances of meaning and association, is apparently nothing, from beginning to end, but an unconscionable tissue of dead, or petrified, metaphors. If we trace the meanings of a great many words—or those of the elements of which they are composed—about as far back as etymology can take us, we are at once made to realize that an overwhelming proportion, if not all, of them referred in earlier days to one of these two things—a solid, sensible object, or some animal (probably human) activity. Examples abound on every page of the dictionary. Thus, an apparently objective, scientific term like elasticity, on the one hand, and the metaphysical abstract, on the other, are both traceable to verbs meaning ‘draw’ or ‘drag’. Centrifugal and centripetal are composed of a noun meaning ‘a goad’ and verbs signifying ‘to flee’ and ‘to seek’ respectively; epithet, theme, thesis, anathema, hypothesis, etc., go back to a Greek verb, ‘to put’, and even right and wrong once had the meanings of ‘stretched’ and so ‘straight’ and ‘wringing’ or ‘sour’. Some philologists, looking still further back into the past, have resolved these two classes into one, but this is immaterial to the point at issue.
POETIC DICTION

‘Nihil in intellectu’, wrote Locke, ‘quod non prius fuerit in sensu.’ And Anatole France, in his *Jardin d’Épicure*, has adorned this theory of thought with a characteristically modern jumble of biological, anthropological, and etymological ideas:

‘Et qu’est-ce-que penser? Et comment pense-t-on? Nous pensons avec des mots; cela seul est sensuel et ramène à la nature. Songezy-y un metaphysicien n’a pour constituer le système du monde, que le cri perfectionné des singes et des chiens. Ce qu’il appelle spéculation profonde et méthode transcendante, c’est de mettre bout à bout, dans un ordre arbitraire, les onomatopées qui criaient la faim, la peur et l’amour dans les forêts primitives, et auxquelles se sont attachées peu à peu des significations qu’on croit abstraites quand elles sont seulement relâchées.

‘N’ayez pas peur que cette suite de petits cris éteints et affaiblis qui composent un livre de philosophie nous en apprenne trop sur l’univers pour que nous ne puissions plus y vivre. Dans la nuit où nous sommes tous, le savant se cogne au mur, tandis que l’ignorant reste tranquillement au milieu de la chambre.’

METAPHOR

Later on, in an imaginary dialogue between a metaphysician and an etymologist, the latter kindly offers to resolve into its elements the sentence ‘L’âme possède Dieu dans la mesure où elle participe de l’absolu’. When he has finished with it, it reads: ‘Le souffle est assis sur celui qui brille, au boisseau du don qu’il reçoit en ce qui est tout délié’.

3. Anatole France’s etymologist, then, sees language as beginning with simple, purely perceptual meanings, and building up, by metaphor, a series of meanings which pretend to be ‘abstract’, when they are really only vague. Now it will at once be seen that the conception of the primitive mind, on which this imagination is based, would make it correspond exactly with the state of consciousness into which the reader was asked to throw himself (II, 5) as the result of a fictitious ‘stroke’. So that the process by which the words mentioned above have acquired the meanings which they now possess would, on this view, be identical with the process by which Shelley was able to write:

My soul is an enchanted boat . . . (Ex. V).

To carry the illustration further: should the
feeling and idea which these lines embody ever become sufficiently well-known and widespread, one can easily perceive how in a few hundred, or in a few thousand years, the word boat might lose its present meaning and call up to the minds of our posterity, not a vessel, but the concept ‘soul’ as enriched by Shelley’s imagination. Language actually abounds, as we shall see, in meanings which have come into it in just this way.

It would seem to follow that, as language grows older, it must necessarily become richer and richer as poetic material; it must become intrinsically more and more poetic. The bald sentence: ‘Le souffle est assis sur celui qui brille, au boisseau du don qu’il reçoit en ce qui est tout délié’, is palpably prosaic, and its original can only begin to arouse imagination and feeling at whatever point in time âme begins to add to its material meaning a vague suggestion of ‘something like breath indeed, but more living, sentient, inward—a part of my Self’, and Dieu to acquire the signification of ‘something like sky, yet more living, corresponding, therefore, to something in me’. Thus, from the primitive meanings assumed by the etymologist, we imagine metaphor after metaphor sprouting forth and solidifying into new meanings—vague, indeed, yet evocative of more and more subtle echoes and reactions. From being mere labels for material objects, words gradually turn into magical charms. Out of a catalogue of material facts is developed—thanks to the efforts of forgotten primitive geniuses—all that we know to-day as ‘poetry’.

Carrying this conception a little further, and ranging outside the terminology of professional metaphysicians, may we not be seized with enthusiasm at the grandeur of such a process? It is by means of language, we shall feel, that we men are made at home in our surroundings at all. To have observed a resemblance between, say, a straight stick and an inner feeling, and to have used the name of the stick to describe the feeling is indeed to have made a long step forward. The flood-gates of Reason have been opened. ‘Metaphorical language’, wrote Shelley, ‘marks the before unapprehended relations of things and perpetuates their apprehension until words, which represent them, become, through time, signs for portions or classes of thought, instead of pictures of integral thoughts.’ From now onward—so we imagine—upon the chaotic
darkness in which it first awoke, human consciousness begins to cast its own brilliant and increasing light. It flings its beams further and further into the night. ‘With the beginning of language’, writes Ludwig Noire, a disciple of Max Müller, ‘the period of spiritual creation began; the light glimmered feebly and inconspicuously at first which now illuminates heaven and earth with its rays—the divine light of reason...’ and he adds, still more enthusiastically:

‘the first step is herewith hewn, by the joint toil of reason and speech, in the hard rock, where a second and then others must follow, till aons hence the lofty summit is reached, and reason enthroned on high sees all the world beneath as the theatre where her might and glory is displayed, and ventures forth upon new flights through the unexplored realms of heaven not even here without a clue, any more than at the hour of her birth, afforded by her own—but now purely ideal—constructions.’

Here again we have a picture of language becoming, intrinsically, more and more poetic; for who could make poetry out of a disjointed

list of unrelated percepts? And what is the very essence of poetry if it is not this ‘metaphorical language’—this marking of the before unapprehended relations of things?

4. And now let us actually examine the sentiments of those who have thought historically, not on language, but on poetry itself. ‘As civilization advances’, said Macaulay, ‘poetry almost necessarily declines.’ Peacock’s *Four Ages of Poetry*, notwithstanding its irony at the expense of ‘progress’, is a genuine dirge on the gradual murder of the Muse by that very Reason, whose ‘divine light’ the philologist was constrained to hymn. Mr. Courthope, in his *Liberal Movement in English Literature*, qualifies a similar opinion by the subtle distinction: ‘As civilization advances, the matter for poetic creation diminishes, while the powers of poetic expression are multiplied’. And even to Shelley, who wrote with the express purpose of refuting Peacock, it is in ‘the infancy of society that every author is a poet, because language itself is poetry’. There is no need to go further for examples. They are found everywhere. Thus the general view is the exact opposite of what one would be led to expect. Indeed, nothing in the world seems
POETIC DICTION

so likely to turn a man into a laudator temporis acti as an historical survey of poetry. Even to-day it remains a moot point among the critics whether the very first extant poet of our Western civilization has ever been surpassed for the grandeur and sublimity of his diction.

Yet if language had indeed advanced, by continual accretion of metaphor; from roots of speech with the simplest material reference, to the complex organism which we know to-day, it would surely be to-day that every author is a poet—to-day, when a man cannot utter a dozen words without wielding the creations of a hundred named and nameless poets. Given the necessary consciousness of this (i.e. an historical knowledge of, and feeling for, language), our pleasure in such sentence as—for example—I simply love that idea—should be infinitely more sublime than our pleasure—as far as the language itself is concerned—in reading Homer. How is it then that,

1 Language reserves one satisfaction for the observer, all the more lively because it is not sought after: the satisfaction, namely, of feeling a metaphor, whose value has not hitherto been understood, suddenly open and reveal itself. Brint: Semantics, p. 129.

METAPHOR

in actual fact, we find this almost universal consciousness that the golden age of poetry is in the infancy of society? Bearing in mind our conclusion that pleasure in poetic diction depends on the difference between two planes or levels of consciousness, we can indeed see why language, at an early stage, should delight us. But what follows? If our theory of the growth of language, by means of metaphor, from simple perceptual meanings to complex psychic ones is a correct theory, it follows that our pleasure in such relatively primitive diction ought to be of a poor and unsatisfying nature, compared to our pleasure in the diction of a modern writer who wields these wonderful meanings. It should be more akin to the pleasure we take in such primitive locutions as Example I, where the change of consciousness is effected by contraction rather than expansion—as for example, by emphasizing those purely external, pictorial relations of things, which sophistication—saving the painter's case—too often induces us to ignore. Is this true? We know at once that it is not. We know from first-hand experience that resemblances between the Greek poetry of Homer's day, or even the Anglo-Saxon of Beowulf's, and, say,
POETIC DICTION

pidgin-English—though they may be interesting—are yet in point of value so slight as to be negligible. We find, in fact, that this old poetry has the knowledge-value, as well as the pleasure-value, and has it in a high degree.

Now, to the genuine critic, the spiritual fact of his own aesthetic experience, when once he knows inwardly that it is purged of all personal affection, must have at least equal weight with any reported historical or scientific facts which may be placed beside it. Beyond that, it must be his aim, as it is the aim of all knowledge, to reconcile or relate conceptually all the elements included in his perceptual experience; among which latter he must number his own aesthetic reactions.

5. Since, then, ancient poetry is simply ancient language at its best (II, 6), we must now try and discover why it is that this best ancient language, when it is compared with the best modern language, so often appears,

not simply as naïve, but, on the contrary, as endowed with an extraordinary richness and splendour. Where, we must ask, is the fallacy in that proud conception of the evolution of language from simplicity and darkness to complexity and light?

It should be remembered that we are here dealing, not with 'poetry', which includes the creative activity itself, but simply with 'poetic diction'—that is to say, with the language of poetic compositions, as we actually find them written in different ages. Someone might come forward and say: But this is nonsense. You are leaving out of account the one thing that really matters and making a mystery of what is left. When people say that Homer has never been surpassed, they mean precisely what they say—that he has never been surpassed. His poetry is sublime because he himself was sublime, and if there has been no such great poetry since, it is because there has been no such great man; or, at any rate, if such a man has lived, he cannot have turned his attention to poetry.

The reply to such an objection would be threelfold: (i) It has already been pointed out that there are certain elements in poetic diction

[ 50 ]

[ 51 ]
POETIC DICTION

which are clearly not traceable to any identifiable individual. (ii) Homer is in any case a bad example to choose, as his individual existence is disputed. (iii) This problem of the responsibility of individuals for poetic value is just one of the most important questions which a theory of poetic diction has to attack. To make any assumptions beforehand would be to beg it. The only way to start with an unprejudiced mind is to take actual examples of poetic diction (see definition, I, 1) and to work backward from them to their sources. This method does not exclude the possibility of arriving eventually at the conclusion expressed in the objection—that the poetic element in language is, and always has been, the result of individual effort, but we have certainly not arrived at that conclusion yet. The question will come up for discussion, in fact, in its proper place.

A hundred and fifty years ago Dr. Hugh Blair wrote in his Lectures on Rhetoric:

'We are apt, upon a superficial view, to imagine that those modes of expression which are called Figures of Speech are among the chief refinements of Speech, not invented till

METAPHOR

after language had advanced to its later periods, and mankind were brought into a polished state; and that then they were devised by orators and rhetoricians. The contrary of this is the truth. Mankind never employed so many Figures of Speech, as when they had hardly any words for expressing their meaning.

'For, first, the want of proper names for every object, obliged them to use one name for many; and, of course, to express themselves by comparisons, metaphors, allusions, and all those substituted forms of Speech, which render Language figurative. Next, as the objects with which they were most conversant, were the sensible, material objects around them, names would be given to these objects long before words were invented for signifying the dispositions of the mind, or any sort of moral and intellectual ideas. Hence, the early language of men being entirely made up of words descriptive of sensible objects, it became, of necessity, extremely metaphorical...'

Now this appears to be a conception of language which, since the time of Locke, has been held by most people who have troubled to write on the subject. Yet it proves (unless one
POETIC DICTION

stretches the meanings of such words as metaphor and trope intolerably far) to be quite unreasonable. For how is it arrived at? In this way: (i) the theorist beholds metaphors and similitudes being invented by poets and others in his own time. (ii) Examining the more recent history of language, he finds many examples of such metaphors having actually become a part of language, that is to say, having become meanings. (iii) Delving deeper still into etymology, he discovers that all our words were at one time ‘the names of sensible objects’, and (iv) he jumps to the conclusion that they therefore, at that time, had no other meaning. From these four observations he proceeds to deduce, fifthly, that the application of these names of sensible objects to what we now call insensible objects was deliberately metaphorical.

In other words, although, when he moves

1 So M. Bréal (Semantique): ‘There is the same difference between the tropes of language and the metaphors of poets as between a product in common use and a recent conquest of science’. See also Chapters VII and VIII post.

2 See Blair, quoted above; and compare Locke (Human Understanding, III, i. 5): ‘Spirit, in its primary signification, is breath; angel a messenger’, etc., etc.

METAPHOR

backwards through the history of language, he finds it becoming more and more figurative with every step, yet he has no hesitation in assuming a period—still further back—when it was not figurative at all! To supply, therefore, the missing link in his chain of linguistic evolution, he proceeds to people the ‘infancy of society’ with an exalted race of amateur poets. Thus, Max Müller in his Science of Language speaks with confidence of the ‘metaphorical period’, describing how:

‘Spiritus in Latin meant originally blowing, or wind. But when the principle of life within man or animal had to be named, its outward sign, namely the breath of the mouth, was naturally chosen to express it. Hence in Sanskrit asu, breath and life; in Latin spiritus, breath and life. Again, when it was perceived that there was something else to be named, not the mere animal life, but that which was supported by this animal life, the same word was chosen, in the modern Latin dialects, to express the spiritual as opposed to the mere material or animal element in man. All this is a metaphor.

‘We read in the Veda, ii. 3, 4: “Who saw the
POETIC DICTION

first-born when he who had no form (lit. bones) bore him that had form? Where was the breath (asuh), the blood (asrik), the self (atma) of the earth? Who went to ask this from any that knew it?"

'Here breath, blood, self are so many attempts at expressing what we should now call "cause".'

It would be difficult to conceive anything more perverse than this paragraph; there is, indeed, something painful in the spectacle of so catholic and enthusiastic a scholar as Max Müller seated so firmly on the saddle of etymology, with his face set so earnestly towards the tail of the beast. He seems to have gone out of his way to seek for impossibly modern and abstract concepts to project into that luckless dustbin of pseudo-scientific fantasies—the mind of primitive man. Not only 'cause', we are to suppose, was within the range of his intellecution, but 'something', 'principle of life', 'outward sign', 'mere animal life', 'spiritual as opposed to mere material', and heaven knows what else. Perverse; and yet for that very reason useful; for it pushes to a conclusion as logical as it is absurd, a view of mental history, which, still implicit in much that passes muster

METAPHOR

as anthropology, psychology, etc.—even as ordinary common sense—might easily prejudice an understanding of my meaning, if it were ignored without comment.

The truth is, of course, that Max Müller, like his predecessors, had only been able to look at 'meaning', and the history of meaning from one imperfect point of view—that of abstraction. For in spite of frequent flights of imagination, the main road of his approach to language was the regulation one from philosophical logic or logical philosophy. Thus, he was an enthusiastic disciple of Kant—even to the Herculean extent of translating the Critique of Pure Reason into English. The full meanings of words are flashing, iridescent shapes like flames—ever-flickering vestiges of the slowly evolving consciousness beneath them. To the Locke-Müller-France way of thinking, on the contrary, they appear as solid chunks with definite boundaries and limits, to which other chunks may be added as occasion arises. Nevertheless, it is a mistake, and a mistake that is commonly made, to underrate Max Müller's semantic flights. The marvel is that with his materials and antecedents he was able to fly so high. Thus, even to this very question of

[56]
POETIC DICTION

metaphor he has an interesting contribution to make. We find him drawing a novel distinction between radical and poetical metaphors:

'I call it a radical metaphor when a root which means to shine is applied to form the names, not only of the fire or the sun, but of the spring of the year, the morning light, the brightness of thought, or the joyous outburst of hymns of praise. Ancient languages are brimful of such metaphors, and under the microscope of the etymologist almost every word discloses traces of its first metaphorical conception.

From this we must distinguish poetical metaphor, namely, when a noun or verb, ready made and assigned to one definite object or action, is transferred poetically to another object or action. For instance, when the rays of the sun are called the hands or fingers of the sun.' Science of Language, p. 451.

In the next chapter I should like to discuss how far this distinction will carry us.

IV

MEANING AND MYTH

1. In his contrast between radical and poetical metaphor, Max Müller distinguished those 'figurative' expressions with which early languages abound from the similitudes deliberately invented by modern poets. This was an important step. Nevertheless, when we come to examine his definition of 'radical' metaphor and to inspect his examples, we can scarcely help being afflicted with grave misgivings. For we find that that definition is based on the old philologist's hypothesis of 'roots of speech'—the theory that every language started with a group of monosyllabic sounds, each of which expressed a simple, general notion. These general notions, it is supposed, were then applied to particular phenomena, among which they were subdivided by the addition of other words; and these latter words finally became the prefixes, suffixes, inflexions, etc., familiar to all students of the Aryan group of languages.
POETIC DICTION

Thus, to the root hab were added various little words implying the notion of particular number and person; but in course of time these coalesced, and the result was an inflected form such as the Latin habuerunt. Finally, by a process commonly alluded to as 'decay', these inflexions were lost and language returned once more to the use of separate words, as in the English they have had.

Now, from the grammatical point of view, it is hardly too much to say that this theory has been hopelessly discredited. Professor Jespersen, for example, in his Progress in Language, has put an overwhelmingly strong case for the opposite view, according to which the flexional (hab-u-erunt) form of language is the earlier, while the isolating or root (they have had) languages (of which Chinese is commonly taken as the most striking example) represent final—not first—stages of a long speech-evolution in which English is already far advanced. 'The evolution of language'—so Professor Jespersen sums it up—'shows a progressive tendency from inseparable irregular conglomerations to freely and regularly combinable short elements.'

Again, if we approach the theory of roots [60]

MEANING AND MYTH

from the semantic point of view, we shall find that here also it falls heavily to the ground. For it owes exactly the same defect as does that theory of metaphor and of a 'metaphorical period' which was elaborated in the last chapter. Moreover, the defect arises from precisely the same cause, namely, that instead of starting from the present and working steadily backwards, the theorist insists on starting, as it were, from both ends at once. He has his idea, or prejudice, concerning the nature of primitive minds—an idea derived from sources quite outside his own study—and somehow or other he is determined to make his history of language coincide with that.

Consequently, just as, in considering metaphor, the fact that he found language growing more and more figurative with every step into the past, did not prevent him from postulating an earliest period in which there were no 'figures' at all; so, the fact that he finds words growing longer and longer and meanings more and more individualized with every step into the past does not prevent him from depicting speech as beginning from monosyllables with general meanings ('roots'). Here it is necessary to point out that a meaning may be [61]
POETIC DICTION

‘perceptual’ (that is to say, the word’s whole reference may be to some sensible object or process) and at the same time ‘general’ or ‘abstract’. Anatole France’s antithesis is, in fact, erroneous. It is just those meanings which attempt to be most exclusively material (‘sensuel’), which are also the most generalized and abstract—i.e. remote from reality. Let us take the simple English word cut. Its reference is perfectly material; yet its meaning is at the same time more general and less particular, more abstract and less concrete, than some single word which should comprise in itself—let us say—all that we have to express to-day by the sentence: ‘I cut this flesh with joy at this moment’. If it is impossible to cut a pound of flesh without spilling blood, it is even more impossible ‘to cut’.

Now it is an indisputable fact that, the further we look back into the history of the meanings of common words, the more closely we find them approximating to this latter, concrete type. Thus, even as recently as the date of the composition of the Fourth Gospel (John, ch. 3, v. and viii.) we can hear in the Greek πνεῦμα an echo of just such an old,

1 See also Appendix II.

[62]

John 3: 5, 8

Spirit / wind - St. John

MEANING AND MYTH

concrete, undivided meaning. This meaning (and therefore, in this case, practically the whole sense of the passage) is lost in the inevitably double English rendering of spirit (v.) and wind (viii.). There are any number of other examples. Here I shall be content to point to our seemingly arbitrary, and now purely verbal allotment of emotion to divers parts of the body, such as the liver, the bowels, the heart, where, in our own day, an old single meaning survives as two separate references of the same word—a physical and a psychic.1

According to Max Müller, it will be remembered, ‘spiritus’—which is of course the Latin equivalent of πνεῦμα—acquired its apparently

1 In stomach we may very possibly have an example of the transition stage—the actual moment of division. For in the twentieth century the expression ‘I have no stomach to the business’ is still by no means purely psychic in its content. It describes a very real physical sensation, or rather one which cannot be classified as either physical or psychic. Yet, on the analogy of the other words mentioned above, it is reasonable to suppose that, when a sufficient number of years has elapsed, the meaning of this word also will have been split by the evolution of our consciousness into two; and the physico-psychic experience in question will have become as incomprehensible to our posterity, as it is incomprehensible to us to-day that anyone should literally feel his ‘bowels moved’ by compassion.

[63]
POETIC DICTION
double meaning, because, at a certain early age, when it still meant simply breath or wind, it was deliberately employed as a metaphor to express 'the principle of life within man or animal'. All that can be replied to this is, that such an hypothesis is contrary to every indication presented by the study of the history of meaning; which assures us definitely that such a purely material content as 'wind', on the one hand, and on the other, such a purely abstract content as 'the principle of life within man or animal' are both late arrivals in human consciousness. Their abstractness and their simplicity are alike evidence of long ages of intellectual evolution. So far from the psychic meaning of 'spiritus' having arisen because someone had the abstract idea, 'principle of life . . .', and wanted a word for it, the abstract idea 'principle of life' is itself a product of the old concrete meaning 'spiritus', which contained within itself the germs of both later significations. We must, therefore, imagine a time when 'spiritus' or άνεμος, or older words from which these had descended, meant neither breath, nor wind, nor spirit, nor yet all three of these things, but when they simply had their own old peculiar meaning, which has since, in the course of the

MEANING AND MYTH
evolution of consciousness, crystallized into the three meanings specified—and no doubt into others also, for which separate words had already been found by Greek and Roman times.

To sum up, if we assume, as it seems only reasonable to assume, that in the ages of speech preceding anything that can be touched by modern etymology the main stream of language, whose course is afterwards to become plainly visible to us, was already flowing in the same direction (i.e. from homogeneity towards dissociation and multiplicity) and not in an opposite one, what is the result? Both 'root' hypothesis and 'metaphor' hypothesis fall to the ground together. Müller's so-called radical metaphor, instead of being primitive, is seen to be one of the latest achievements of conscious linguistic development. A better name for it would be synthetic metaphor; and a better example, say, gramophone. 'Roots', far from being the germs of speech, are the product of ages of intellectual abstraction carried on, first, instinctively by ordinary speakers, and afterwards deliberately by the grammarians and philologists. The service rendered by these latter both to speech and to thought is of the utmost importance; their error merely lay
POETIC DICTION

in supposing that life actually created language after the manner in which their logic reconstructed it. They mistook elements for seeds—and called them roots.

2. Used with due caution, the mental progress of the individual from infancy to maturity is likely to provide some evidence of the mental history of the race; for the peculiar relation between phylogensis and ontogenesis, which is summed up in the word 'recapitulation', quite evidently applies, within broad limits, to mind as well as body. Consequently, a consideration of the development of 'meaning' in the life-history of the individual would be pertinent to the matter in hand. There is clearly no room here to go into such a question in detail, but I should like to refer to the American psychologist, J. M. Baldwin, who has pointed out how the adult observer constantly misreads his own logical processes into the child's mind. He shows how a child's apparent 'generalizations' are in reality single meanings, which it has not yet learnt to split up into two or more. 'All psychic dualisms

1 See Appendix IV.

2 For example, while every man is papa, this does not mean that the child uses the word papa to express a general

MEANING AND MYTH

and distinctions', he points out, 'are meanings in the sense that they are differentiations from earlier and more simple [sic] apprehensions.'

Finally, while it is a tiresome and stupid error to suppose that the childhood of races whose blood was afterwards to blossom into a Plato or a Shakespeare can be safely deduced from the present condition of peoples inhabiting Tasmania or the islands of the Pacific, nevertheless there are cases in which the one may conveniently be illustrated by the other. It is interesting, therefore, to find anthropologists telling us of the 'holophrase', or long, rambling conglomeration of sound and meaning, which is found among primitive and otherwise almost wordless peoples. Moreover, we hear again and again of primitive languages in which there are words for 'gum-tree', 'wattle-tree', etc., but none for 'tree'; and R. R. Marett, in his little book, *Anthropology*, remarks that in some crude tongues, although you can express twenty different kinds of cutting, you cannot idea, 'man'. He has no such general idea. He has one single meaning, 'papa', but it is a meaning which contains within itself the capacity to split up or unfold or evolve into two separate ideas, 'Father' and 'man', of which one is more particular, and the other more general than the original 'portmanteau' meaning.
POETIC DICTION

say 'cut'. One could take many other examples from the chapter on Language in this book, to illustrate the distinction drawn above between concrete meanings and abstract meanings, a distinction which I have endeavoured to discuss a little more fully in an Appendix (IV).

3. We are now in a position to survey once more the apparent contradiction remarked above (III, 4–5) between aesthetic and philosophical judgments. On the one hand, the poet and the critic find language growing more and more poetic as they trace it back into the past. On the other, the Locke-Whitney-Müller-France way of thinking sees the beginnings of language in a series of monosyllabic 'roots' with simple, perceptual references. What is the solution of this paradox? Hitherto, as far as I am aware, the only one worthy of the name has been that which is fairly common as vague idea, but which is found explicitly in Max Müller—that of the 'metaphorical period', a wonderful age when a race of anonymous and mighty poets took hold of this catalogue-like vocabulary and saturated it with poetic values. It is important to recollect that, as we saw in III, 4, these values are not merely poetic in the sense of causing pleasure, but also in the true, creative sense, as causing wisdom.

Recognition of this last fact should keep us from a certain tangle of loose thinking into which many evidently slip, to whom the existence of poetry is not an actual fact of phenomenal experience, nor its presence one of their measures of reality. For it is not infrequently suggested that the mere fact of direct connection with sensuous experience is enough to render language poetical. Thus, we find Macaulay asserting that half-civilized nations are poetic simply because they perceive without abstracting, and absolutely regardless of what they perceive. And a similar view is taken by Jespersen, who is otherwise content to dismiss the whole question of poetic values with the somewhat superficial reflection that after all 'we cannot all be poets'.

1 Essay on Milton, p. 3. 'Nations, like individuals, first perceive and then abstract. They advance from particular images to general terms. Hence the vocabulary of an enlightened society is philosophical, that of a half-civilized people is practical.' It is clear that Macaulay is here using the word 'perceive' in the ordinary, wider sense—the sense in which I use 'observe' (see II, 5; note).

2 Progress in Language, § 273.

3 Ibid., § 79.
POETIC DICTION

an admission, if once upon a time we all were poets!

Of these two theories, I have endeavoured to show my reasons for regarding the first as absurd and untenable. The second is, of course, not a solution at all. It merely shifts the locus of the problem; for we are still left asking why this direct perception should in itself have value as cause of wisdom. Indeed, the superficiality of such a view is so palpable that we can only suppose it to be the outcome of a consciousness to which the expression 'poetry as cause of wisdom' corresponds with no concrete experience, but is rather a contradiction in terms. There is, however, a third solution, and I suggest that it is one to which we are necessarily led by all that has gone before. It is this: that these poetic, and apparently 'metaphorical' values were latent in meaning from the beginning. In other words, you may imply, if you choose, with Dr. Blair, that the earliest words in use were 'the names of sensible, material objects' and nothing more —only, in that case, you must suppose the 'sensible objects' themselves to have been something more; you must suppose that they were not, as they appear to be at present,

MEANING AND MYTH

isolated, or detached, from thinking and feeling. Afterwards, in the development of language and thought, these single meanings split up into contrasted pairs—the abstract and the concrete, particular and general, objective and subjective. And the poesy felt by us to reside in ancient language consists just in this, that, out of our later, analytic, 'subjective' consciousness, a consciousness which has been brought about along with, and partly because of, this splitting up of meaning, we are led back to experience the original unity.

Thus, the sunstruck or 'meaningless' man, into whose consciousness we endeavoured to enter in II, 5, is in no sense whatever (as Anatole France, for instance, assumed) an analagon of primitive man. To make him that, we should have to conceive of him —so far from being meaningless—as literally resounding with all manner of meaning, and moreover, with meaning such that, if he could but communicate it to us, we should be listening to poetry.

Then what is a true metaphor? In the same essay of Shelley's, from which I have

1 See also Appendix IV.
POETIC DICTION

already quoted, he cites a fine passage from Bacon's *Advancement of Learning*:

'Neither are these only similitudes, as men of narrow observation may conceive them to be, but the same footsteps of nature, treading or printing upon several subjects or matters.'

This is the answer. It is these 'footsteps of nature' whose noise we hear alike in primitive language and in the finest metaphors of poets. Men do not *invent* those mysterious relations between separate external objects, and between objects and feelings, which it is the function of poetry to reveal. These relations exist independently, not indeed of Thought, but of any individual thinker. And according to whether the footsteps are echoed in primitive language or, later on, in the made metaphors of poets, we hear them after a different fashion and for different reasons. The language of primitive men reports them as direct perceptual experience. The speaker has perceived a unity, and is not therefore himself conscious of relation. But we, in the development of consciousness, have lost the power to see this one as one. Our sophistication, like Odin's,

1 *Advancement of Learning*, II, v. 3.

[72]

MEANING AND MYTH

has cost us an eye; and now it is the language of poets, in so far as they create true metaphors, which must *restore* this unity conceptually, after it has been lost from perception. Thus, the 'before-unapprehended' relationships of which Shelley spoke, are in a sense 'forgotten' relationships. For though they were never yet apprehended, they were at one time seen. And imagination can see them again.

In the whole development of consciousness, therefore, we can trace the operation of two opposing principles, or forces. Firstly, there is the force by which, as we saw, single meanings tend to split up into a number of separate and often isolated concepts. This is the *vóýlētēus* of Shelley's *Essay*. We can, if we choose, characterize it as non-poetic—even as anti-poetic, so long as we remember that for the *appreciation* of language as *poetry*, this principle is every whit as necessary as the other. The second principle is one which we find given us, to start with, as the nature of language itself at its birth. It is the principle of living unity. Considered subjectively, it observes the resemblances between things, whereas the

1 *A Defence of Poetry*, p. 1. I keep his term, though Liddell and Scott give *lóyóλεθας* only.

[73]
POETIC DICTION

first principle marks the differences, is interested in knowing what things are, whereas the first discerns what they are not. Accordingly, at a later stage in the evolution of consciousness, we find it operative in individual poets, enabling them (πέποιητον) to intuit relationships which their fellows have forgotten — relationships which they must now express as metaphor. Reality, once self-evident, and therefore not conceptually experienced, but which can now only be reached by an effort of the individual mind — this is what is contained in a true poetic metaphor; and every metaphor is 'true' only in so far as it contains such a reality, or hints at it. The world, like Dionysus, is torn to pieces by pure intellect; but the poet is Zeus; he has swallowed the heart of the world; and he can reproduce it as a living body.

1 Cf. Bacon: Novum Organum, i. 55.

Maximum et velut radicile discrimen ingeniorum, quod philosophiam et scientias, illud est: quod aliqua ingenia sint fortiora et aptiora ad notandas rerum differentias; alia, ad notandas rerum similitudines. Ingenia enim constantia et acuta figuré contemplationes, et morari, et haerere in omnibus subtilitate differentiarum possunt; ingenia autem sublimia et discursiva etiam tenacissimas et catholici rerum similitudines et agnoscent et componunt: utrumque autem ingenium facile habitur in excessum, presensque aut gradus rerum, aut umbas.

[74]

MEANING AND MYTH

It is really not at all surprising that philosophers should have had such a vivid hallucination of metaphor bending over the cradle of meaning. For the distinction is a distinction of agent rather than of function, and the principle is indeed one. Nevertheless it is better to keep the definition of the label metaphor within bounds and thus to deny it to these early Meanings, which appear in the world without individualized poetic effort. Figure and figurative, on the other hand — as long as we disentangle them carefully in our minds from the modern expression, 'figure of speech' may justly be applied, owing to the perceptual or aesthetic, the pictorial, form in which these unitary Meanings first manifest in consciousness. Not an empty 'root meaning to shine', but the same definite spiritual reality which was beheld on the one hand in what has since become pure human thinking; and on the other hand, in what has since become physical light; not an abstract conception, but the echoing footsteps of the goddess Natura — not a metaphor but a living Figure.

4. Perhaps nothing could be more damning to the 'root' conception of language than the ubiquitous phenomenon of the Myth. Now

[75]
myth, at any rate for the Aryan peoples, is intimately bound up with the early history of meaning. It is the same with innumerable words; if one traces them back far enough, one reaches a period at which their meanings had a mythical content. To take such English words as panic, hero, fortune, fury, earth, North, South, is merely to lay hands on the most obvious examples. A glance at Vedic will make much clearer the enormously wide scope of this historical phenomenon. Yet the ‘root’ theory of language and its affiliated conceptions either have nothing to say on this head, or they suggest the most sterile trivialities. The reason of this is fairly plain. Upon such a view the myths must be the product of that same mysterious ‘metaphorical period’ when the inventive genius of humanity is said to have burgeoned and sprouted as never before or since. Thus Max Müller, who perceived very clearly the intimate bond connecting myth with metaphor and meaning, was actually obliged to characterize the myth as a kind of disease of language.¹ Such a point of view is barely worth discussing, or rather, to the genuine critic, it is not worth discussing. For,

¹ The Science of Language, II, 454 ff.

for him, the poetic knowledge-values which he finds over and over again in myth would themselves be an immediate and sufficient answer. The word ‘disease’ is meaningless in such a connexion.

On the other hand, the more widely accepted ‘naturalistic’ theory of myths is very little more satisfactory. For it is obliged to lean just as heavily on the same wonderful metaphorical period. The only difference is this, that for an extinct race of mighty poets it substitutes an extinct race of mighty philosophers. In either case, we must admit that the posthumous obscurity of these intellectual giants is ill-deserved, considering that the world owes to them (to take only one example) practically the entire contents of Lemprière’s Classical Dictionary. The remoter ancestors of Homer, we are given to understand, observing that it was darker in winter than in summer, immediately decided that there must be some ‘cause’ for this ‘phenomenon’, and had no difficulty in tossing off the ‘theory’ of, say, Demeter and Persephone, to account for it. A good name for this kind of banality—the fruit, as it is, of projecting post-logical thoughts back into a pre-logical age—would perhaps be ‘Logo-
morphism'. Whatever we call it, there is no denying that it is at present extraordinarily widespread, being indeed taken for granted in all the most respectable circles. Imagination, history, bare common sense—these, it seems, are as nothing beside the absolute necessity that the great Mumbo Jumbo, the patent, double-million magnifying Inductive Method, should be allowed to continue contemplating its own ideal reflection—a golden age in which every man was his own Newton, in a world dropping with apples. Only when poesy, who is herself alive, looks backward, does she see at a glance how much younger is the Tree of Knowledge than the Tree of Life. 1

5. For to the poetic understanding myth presents an altogether different face. These fables are like corpses which, fortunately for us, remain visible after their living content has departed out of them. In the Classical Dictionary, the student of poetic diction finds delicately mumified for his inspection any number of those old single meanings, which the differentiating, analytic process already referred to has desiccated and dissected. Goethe gave symbolical expression to this

1 See also Appendix IV.

[78]
POETIC DICTION

these. The psycho-analyst is right when he connects the myth with 'inner' (as we now call them) experiences, but wrong if he deduces it solely from these. Mythology is the ghost of concrete meaning. Connexions between discriminate phenomena, connexions which are now apprehended as metaphor, were once perceived as immediate realities. As such the poet strives, by his own efforts, to see them, and to make others see them, again.

In a work with the present title, one need have no hesitation in making such round assertions; for either they are true, or poetry itself is a dream and a disease. 'It is easily seen', wrote Emerson, referring especially to the kind of metaphor or analogy which relates the 'inner' experience to the 'outer':

'that there is nothing lucky or capricious in these analogies, but that they are constant, and pervade nature. These are not the creams of a few poets, here and there, but man is an analogist, and studies relations in all objects. He is placed in the centre of beings, and a ray of relation passes from every other being to him. And neither can man be understood without these objects, nor these objects without

[80]

MEANING AND MYTH

man. All the facts in natural history taken by themselves have no value, but are barren like a single sex. But marry it to human history, and it is full of life. . . .

'Because of this radical correspondence between visible things and human thoughts, savages, who have only what is necessary, converse in figures. As we go back in history, language becomes more picturesque, until its infancy, when it is all poetry; or all spiritual facts are represented by natural symbols.' 1

1 Emerson: Nature, Ch. IV on 'Language'.

[81]
LANGUAGE AND POETRY

Thus, a history of language written, not from the logician's, but from the poet's point of view, would proceed somewhat in the following manner: it would see in the concrete vocabulary which has left us the mythologies the world's first 'poetic diction'. Moving forward, it would come, after a long interval, to the earliest ages of which we have any written record—the time of the Vedas in India, the time of the Iliad and Odyssey in Greece. And at this stage it would find meaning still suffused with myth, and Nature all alive in the thinking of man.

The gods are never far below the surface of Homer's language—hence its unearthly sublimity. They are the springs of action and stand in place of what we think of as personal qualities. Agamemnon is warned of Zeus in a dream, and Telemachus, instead of 'plucking up courage', meets the goddess Athene and

[82]

LANGUAGE AND POETRY

walks with her into the midst of the hostile suitors.

Millions of spiritual beings walk the earth. . . .

And these august beings, speaking now from the mouths of the characters, and again passing and repassing invisible among them, dissolve into a sort of largior aether, which the Homeric heroes breathe all day; so that we, too, breathe it in the language they speak—in their ἀποδείκνυσις ἡμῶν, their ἵστορ ἡμῶν, in the sinewy strength of those thundering epithets which, for all their conventionality, never fail to impart life and warmth to the lines.

Meanwhile, the historian would note how the anti-poetic, or purely rational, had begun to take effect. He would find meanings splitting up in the manner previously described and language beginning to change its character, to lose its intrinsic life. He might note, also, that the increased action of this principle was accompanied by the birth of hitherto unknown antitheses, such as those between truth and myth, between prose and poetry, and again between an objective and a subjective world; so that now, for the first time, it becomes possible to distinguish the content of a word from its reference.

[83]
POETIC DICTION

He might then, perhaps, look to the history of philosophy for some indication of the moment at which the ascending rational principle and the descending poetic principle (for, in certain respects, we can think of them as of two buckets in a well) are passing one another. If so, I think he would fix on the prominence in men's minds of the metaphysical problem of 'universals'. For when the number of general ideas arrived at by abstraction (see IV, 1) is rapidly increasing, and yet there is still a strong sense of the old, concrete, unitary meanings, it is natural that the co-existence of two kinds of universal should arouse confusion. Are universals real beings, it is asked, or mere classifying abstractions in the minds of men, evolved for the convenience of quick thinking? The latter (Nominalist-Conceptualist) verdict, if applied indiscriminately to all universals, may be compared with the error, noted in IV, 2, by which an adult thinker reads his own generalizations into a child's mind.

Thus the old, instinctive consciousness of single meanings, which comes down to us as the Greek myths, is already fighting for its life by Plato's time as the doctrine of Platonic Ideas (not 'abstract', though this word is often erroneously used in English translations); Aristotle's logic and his Categories, as interpreted by his followers, then tend to concentrate attention exclusively on the abstract universals, and so to destroy the balance; and then again the forms and entelechies of Aristotle are brought to life in the poetry of Dante as the Heavenly Hierarchies; and, yet again, Nominalism, with its legacy of modern empirical philosophy and science, obscures men's vision of all but the abstract universals.¹

Thus would he find the general progress obscured and varied by all sorts of particular forces operating in the history of civilization. For example, if he chose the Aryan community of speakers as his canvas, he would have to consider, on the one hand, the history of

¹ Naturally, this sketchy account must be met half-way, and with considerable delicacy of apprehension, if it is to have any truth and meaning. Any rigidly regular development of the two principles is out of the question. Inmate differences between mind and mind, together with the increasing intercommunication of recorded thought and its transmission from past to present, are always at work to spread the process. The two principles themselves, however, and their historical development, are none the less realities because, like the aesthetic values, they do not force themselves on the attention of the percipient, but await the exertion of his own imaginative activity.
POETIC DICTION

Aryan language and Aryan consciousness as a whole, and, on the other, the rise and decay—within that single entity—of the various national languages and national spirits among which it has been distributed. Each of these, he would probably find, repeats in its own compass, and in varying degrees, the broad lines of evolution of the whole. Thus, within certain limits, we should be brought to see that, in poetic character, the Latin language is to the Greek as the later stages of Greek are to its own earlier stages; and, also, as the later stages of English are to its earlier stages.

2. For example, there is a certain halflspurious element in the appreciation of poetry, with which everyone will be familiar, when one takes delight, not only in what is said and in the way it is said, but in a sense of difficulties overcome—of an obstreperous medium having been masterfully subdued. It is a kind of architectural pleasure. One feels that the poet is working in solid masses, not in something fluid. One is reminded by one's very admiration that 'words are stubborn things'. In English literature Milton's verse presents a particularly striking example of what I mean; and I select a quotation almost at random, hoping that it will make my meaning clear:

Fall'n Cherube, to be weak is miserable
Doing or Suffering: but of this be sure,
To do ought good never will be our task,
But ever to do ill our sole delight,
As being the contrary to his high will
Whom we resist. If then his Providence
Out of our evil seek to bring forth good,
Our labour must be to pervert that end,
And out of good still to find means of evil.

It is demonstrable that this architectural element in poetic diction is something which only arises at a certain stage in the development of a language. It is there in the iambics of the Attic dramatists, but not in Homer's hexameters; yet it is not entirely foreign to the spirit of the hexameter, for it is conspicuous in Virgil:

At regina dolos (quis fallere posset amantem?)
Præsensit motusque exceptit prima futuros,
Omnia tuta timens. Eadem impia Fama furenti
Detulit armari classem cursuque parari.

Indeed Virgil's poetry is an excellent example. It is in his most famous and most often-quoted passages that we find that exquisite hint, as it were, of the jig-saw puzzle; and, along with it, that exact use of quantitative values and the
POETIC DICTION

marvellous interweaving of these with the different stresses which would normally be given to the sentences, in accordance with their emotional content.

This subtle music is the very life of the Aeneid. But it is a life that is imparted by Virgil himself, in his arrangement of the words, rather than one inherent in the Latin language. There is quite another kind of life in the Iliad—that of the old Greek language itself. Compare the vigour and brilliance of Homer's epithets with the best equivalents that Virgil could find for them: celer for πτιγίως, curvis naves for νής διπλευκάς, flumine pulchro for καλλιβρόθον ποτάμος, etc. And we find the same contrast—a contrast, as it were between movement and rest—working itself out in broader curves in the descriptions of the shields (Iliad, xxiii, and Aeneid, viii, 607–731), where Homer instinctively translates the description of motionless objects into action, while Virgil finds it natural to employ the static mode of 'here is . . .', 'there is . . .'.

There is a strong tendency in the Greek

LANGUAGE AND POETRY

language, with its reckless profusion of double epithets, its looser word-order, and its nervous, restless twitchings of grammatical particles, to make itself felt as a living, muscular organism rather than as a structure; and it is quite in harmony with this that the terminology of grammar, most of which is derived from Greek, should have originated in so many cases as physical or physiological metaphor. In Horace's Sapphics and Alcaics, on the other hand, the architectural element practically reaches its zenith. And again, if we turn to the history of English, I do not think we can say that we find this architectural element at all pronounced until the seventeenth century. It strikes us, for instance, in Milton and in the Metaphysicals, and frequently afterwards, but hardly in Chaucer or Shakespeare.

To characterize further the difference between what I have ventured to describe as the fluid type of poetry and the later, architectural type: in the latter, elisions tend to become less frequent, whilst (in verse) the number of syllables in a single foot or time-interval grows less easily variable. Another test is this: it is much harder to convey the full effect of poetry

[ 88 ]

1 Moreover, Homer shows us Hephaestus actually fashioning the shield, whereas Virgil speaks as a spectator examining the finished product.

1 E.g. πτιγίως, ἄθροι, συνθέμος, etc.

[ 89 ]
of the architectural type with the voice. The eye seems to be necessary as well, so that the shape of a whole line or period can be taken in instantaneously. The actual sounds have grown more fixed and rigid and monotonous; the stresses accordingly are more subtle, depending upon the way in which the emotional meaning—as it were—struggles against this rigidity; and this produces a music different indeed, but none the less lovely because it is often audible only to the inward ear. The fluid type of verse, on the other hand, is made for reciting or singing aloud and always gains more than it loses by this method of delivery.

3. It is especially interesting that we find this transition of poetry from an organic to a relatively structural character reflected in the formal history of language itself. For, assuming that Jespersen's view of the direction of progress is correct, we can trace the change from a flexional state, in which word-order is relatively unfixed and unimportant, towards a final state in which word-order is fixed and so essential to the expression of meaning that a slight change may actually reverse the sense—as in the English sentence 'The Gentle-

Language and Poetry

men beat the Players'. Of known languages, Chinese is again, apparently, the furthest developed in this direction. To the poet or critic, a language which has reached this last stage presents the appearance of a kind of crystallization, the semantic elements requiring to be rearranged in a series of kaleidoscopic jerks. Whereas in a language still at the 'flexional' stage the meaning, vague in its outlines, but more muscular and alive, can afford to leave even the words themselves as though still in motion. The reader has not the same sense of their being set and fixed in their places.¹

Here it is worth remarking on a phenomenon in the history of philology which comes in for some ridicule at the hands of Jespersen. I mean the pronounced tendency to refer to the flexional type of language as 'strong' and the analytic type as 'weak'. In the same way the loss of inflexions has long been regarded in philological circles as a symptom of 'decay' or 'senility'. Jespersen attributes the origin of this incorrigible philological prejudice to pedantic preoccupation with Latin and Greek; its

¹ For a change of meaning of this nature see VII, 2 and 3.
POETIC DICTION

maintenance he assigns to blind tradition. He sums up in a masterly manner the enormous advantages in point of economy and lucidity which the analytic language possesses over its flexional ancestor and pronounces himself unable to see any meaning in the use of such a word as 'senility' in such a connexion.

In my view, however, this well-worn terminology of the philologists springs from a kind of true instinct for poetic values. Mr. Jespersen, in his Progress in Language, builds argument upon argument to prove that the historical development of language is indeed 'progressive' and not a kind of falling away from grace, as his predecessors held. These arguments are absolutely convincing and require no comment, as long as we remember that, to the author, 'progress' in the history of consciousness does not merely include, but is synonymous with an increasing ability to think abstract thoughts. This fact grows more and more apparent as one reads on, until at last one realizes that, where Coleridge failed, Mr. Jespersen has succeeded in 'taming down his mind to think poetry a sport or an occupation for idle hours.' But I have already referred to the summary manner in which the distinguished Danish philologist dismisses this side of his subject.

The poetic historian of language, therefore, would certainly have to consider such a question as the following: is there some period in the development of a language at which, all other factors being excluded, it is fittest to become the vehicle of great poetry; and is this followed by a kind of decline? We might suppose that at a certain stage the rational, abstracting, formal principle will have stayed and confined the primal flow of meaning to an extent which is just exquisite; that this is the moment of all moments for the great poet to step in; and that in a century or so the balance will have been destroyed, the formal principle have run ahead, so that in the greatest poetry we shall have henceforth that Miltonic flavour—delightful indeed, but perhaps a thought less divine—of cyclopean achievement and rest after labour. It can hardly be doubted that this period would be found to bear some recognizable relation to that point of balance between the rational and the poetic, to which I referred earlier in the chapter. But I may not put this forward as more than a suggestion; for the poetic history of language which I have attempted
POETIC DICTION

to sketch upon air, would need for its actual bringing down to earth a far wider culture and an acquaintance with a great many more languages and literatures than I can lay claim to. Faciant meliora potentes.

vi

THE POET

1. In II, 3, and again in III, 5, the question was raised of the responsibility of individuals for poetic values. Now an answer to this question is really implicit in what has since been said. It will no doubt be realized therefore that the extent of this responsibility is variable, increasing with the 'progress' of language in any community of speakers. For it has been shown that poetic values abound, as meaning, in the early stages of those languages with which we are familiar; this meaning has then been traced back to its source in the theocratic, 'myth-thinking' period, and it has been shown that the myths, which represent the earliest meanings, were not the arbitrary creations of 'poets', but the natural expression of man's being and consciousness at the time. These great 'meanings' were given, as it were, by Nature, but the very condition of their being given was that they could not at the same time be apprehended
POETIC DICTION

in full consciousness; they could not be known, but only experienced, or lived. At this time, therefore, individuals cannot be said to have been responsible for the production of poetic values. Not man was creating, but the gods—or, in psychological jargon, his 'unconscious'. But with the development of consciousness, as this 'given' poetic meaning decreases more and more, the individual poet gradually steps into his own. In place of the simple, given meaning, we find the metaphor—a real creation of the individual—though, in so far as it is true, it is only re-creating, registering as thought, one of those eternal facts which may already have been experienced in perception.

We have seen also how this change in the nature of poetry is intimately connected with the development of the rational principle (by which meaning is split up) at the expense of the poetic principle. Owing to familiar associations, this use of the word 'poetic' may still be misleading, unless we are willing to consider it a little further. In II, 3, it was pointed out as matter of immediate experience that what is poetry to the reader or hearer need not have been poetry to its maker. This

[96]

THE POET

may now be put more strongly: inasmuch as man is living the poetry of which he is the maker, and as long as he is so doing, it cannot be poetry to him. In order to appreciate it, he himself must exist, consciously, outside it; for otherwise the 'felt change of consciousness' cannot come about. Now nothing but the rational, or logistic, principle can endow him with this subjective — self — consciousness.\(^1\) Hence it was justly inferred (IV, 3) that the functioning of the rational principle is indispensable, if appreciation is to take place. The absolute rational principle is that which makes conscious of poetry but cannot create it; the absolute poetic principle is that which creates poetry but cannot make conscious of it. It follows from this that, the further back we look, and the more we see what I have called the poetic principle active in language, the less appreciation of poetry shall we find. And though this may at first sight look startling, I believe there is no doubt that it is true. Let us, however, consider a few opinions on the subject.

Macaulay, it is true, regards the fact that (according to Plato) the old Rhapsodists could

\(^1\) For a fuller treatment of this, see Appendix IV.

[97]
POETIC DICTION

scarcely recite Homer without falling into convulsions as evidence of a greater capacity in the ancients for 'enjoying poetry'! In later ages, he says, 'Men will talk about the old poets, and comment on them, and to a certain degree enjoy them. But they will scarcely be able to conceive the effect which poetry produced on their ruder ancestors, the agony, the ecstasy, the plenitude of belief. . . . The Mohawk hardly feels the scalping-knife while he shouts his death-song.'

And Gibbon takes a similar line in his characteristic account of the Teutonic bards:

'Among a polished people, a taste for poetry is rather an amusement of the fancy, than a passion of the soul. And yet, when in calm retirement we peruse the combats described by Homer or Tasso, we are insensibly seduced by the fiction and feel a momentary glow of martial ardour. But how faint, how cold is the sensation which a peaceful mind can receive from solitary study! It was in the hour of battle, or in the feast of victory, that the bards celebrated the glory of heroes of ancient days, the ancestors of those warlike chieftains who listened with transport to their artless but

THE POET

animated strains. The view of arms and of danger heightened the effect of the military song; and the passions which it tended to excite, the desire of fame, and the contempt of death, were the habitual sentiments of a German mind.'

Now if we examine these modest admissions of aesthetic inferiority a little farther, we shall find them to be based on the following assumption: that human experience must have been 'faint', unless it produce some violent physical effect. This childish materialism scarcely needs refuting. We may, however, use the indiscretion of two famous historians as a reminder that any attempt to unseal the sources of poetry is certain to be abortive, unless the critic can distinguish between the mood of creation and the mood of appreciation—a distinction which the piercing gaze of Shelley had, as usual, no difficulty in remarking:

'In the infancy of the world, neither poets themselves nor their auditors are fully aware of the excellence of poetry: for it acts in a divine and unapprehended manner, beyond and above consciousness; and it is reserved for future generations to contemplate and measure the
POETIC DICTION

mighty cause and effect in all the strength and splendour of their union.' *A Defence of Poetry.*

Thus, it must be understood that when I speak of the poetic I mean what many people would prefer to call the 'creative'. The poet is a man speaking to men. In order that 'poetry', strictly so called, should exist, an appreciating imagination, in which aesthetic experience can light up, is of course as necessary as the creative activity of the poet. And so, although the poetic principle in language has waned since Homer’s day, poetry as inner experience has increased. The light of conscious poesy which can irradiate a modern imagination, as it comes into contact with, say, the Homeric hexameters, is not to be compared with such fitful aesthetic gleams as must indeed have flared up now and again amid the host of grosser pleasures preoccupying the dim self-consciousness of his own (probably half-intoxicated) audience.

2. Precisely parallel to the history of civilization in this respect, is the aesthetic history of the individual. One need only refer to Wordsworth's theory and practice alike for a full

THE POET

statement of the way in which the child's experiences can acquire poetic value as remembered by the conscious, full-grown man. The old, single, living meanings (IV, 2) which the individual, like the race, splits up and so kills, as he grows, are allowed to impinge as memory on the adult consciousness; and the result is pure aesthetic experience. This is the true sense in which the child is father of the man.

Thus, in both cases, the individual is thrown more and more upon his own resources as time goes on: he can draw upon his own and his race's childhood for wisdom, and the gaining of that wisdom will be accompanied by aesthetic experience. The amount of knowledge which is thus accessible, however, will obviously be limited. Whatever vast truths may have been laid open to the vague, yet living, consciousness of his ancestors or his infancy, it is certain that history and memory will actually have preserved no more than a fragment. In this respect our human consciousness is something like a man who should try, by turning round, to see the back of his head in a mirror. For the impulses to record and to remember can only come into it along with the very change that begins to obscure perception of what is
POETIC DICTION

most worth remembering. If the later man wishes to increase this limited store of wisdom, therefore, he has to look for some way of renewing the immediate activity of the poetic principle. No longer does he find this operative of its own accord in the meanings of words; indeed, the modern poet is in some sense, as we saw in the last chapter, in the position of having to fight against words, whereas the primitive bard was carried forward on their meanings like Arion on the dolphin's back. Where then does the modern poet find again this poetic principle that is dying out of language? Where? Nowhere but in himself. The same creative activity, once operative in meaning without man's knowledge or control, and only recognized long afterwards, when he awoke to contemplate, as it were, what he had written in his sleep, this is now to be found within his own consciousness. And it calls him to become the true creator, the maker of meaning itself.

3. I have said 'within his own consciousness', but this expression, too, is misleading unless it is understood historically. The poet, purely as creator, cannot even to-day be regarded as a self-conscious individual, for such consciousness is impossible without rational, analytic thought. In so far as his own poetic activity comes within his knowledge and control, in so far as he can appreciate, and so correct, his own poetry, or choose what he will write, he is not maker, but comparer, or judge; and he cannot be both simultaneously. There is a mood of creation and a mood of appreciation. This was no doubt at the back of the critic's mind who said that 'to write well of love a man must be in love, but to correct his writing he must be out of it again'.

Yet if the intellectual and active powers are, in Emerson's phrase, 'exclusive', the interval of time which must elapse between their alternations need not be fixed. Nor is it. We may realize the delicacy and rapidity with which they must be considered as interacting, if we reflect that the bare fact of verbal expression implies the operation of the rational principle. Outside proper names, every word in every language is a generalization, and, when we speak of the poetic values being 'given' in early language, we must not lose sight of the fact that these values were already fading, were already but relics of still more living values.
POETIC DICTION

which must have obtained in consciousness before the birth of speech. Without reason—and reason in the rationalist's, not the dialectician's sense—there could have been no speech, as we understand it, at all. It follows that the poet's power of expression will be dependent on the development of the rational principle in himself. A great poet spells a great intellect, and such an one is fairly sure to have the faculty of delighting in abstract thought. Is it necessary to cite the acute analytical thinking in Keats' and Shelley's letters, the flawless forensic armour of Milton's Satan, the discursive vigour of the Paradiso, or the logical fisticuffs of Shakespeare's comic characters?

But apart from the more subtle interaction of the two principles which is implied in the mere existence of language, we have to consider the time-interval between the mood of poetic creation proper and the mood of appreciation, or of mere inactivity, if we wish to grasp the reality behind the expression 'within his own consciousness', which I employed above.

Now when we look back at the attitude

1 Cf. Aristotle (De Anima, III, 2, v.), ὡς τοῦ ποιητοῦ καὶ κυριηκοῦ ἔτερεν ἐν τῷ πάροχω διεργασθεῖ: I would rather not attempt to translate this into English.

THE POET

which his fellowmen have maintained towards the poet, from the time when they first became conscious of him as something apart from themselves, we shall again, I think, find something in the nature of a 'progress'. First, the poet was conceived of as being definitely 'possessed' by some foreign being, a god or angel, who gave utterance through his mouth, and gave it only as and when it chose. Then the divine power was said to be 'breathed in' to the poet, by beings such as the Muses, at special times and places, over which he had some measure of control, in that he could go himself to the places and 'invoke' the Muse. Finally this 'breathing in' or inspiration took on the more metaphorical sense which it has to-day—definitely retaining, however, the original suggestion of a diminished self-consciousness. Inspiration! It was the only means, we used to be told, by which poetry could be written, and the poet himself hardly knew what it was—a kind of divine wind, perhaps, which blew where it listed and might fill his sails at some odd moment after he had whistled for it all day in vain. So we were told not long ago; but to-day we are more inclined to think of inspiration as a mood—a mood that
POETIC DICTION

may come and go in the course of a morning's work.

Thus, throughout the history of poetry we can discern, reflected at any rate in opinion, a gradual reduction of the inevitable interval between the two moods, which remain nevertheless incompatible in their essential nature; till to-day this huge change from poetic to appreciative, from creative to contemplative, which the material he is working in—language—has itself been performing in one direction over a period measured by millenniums, flickers with dazzling rapidity in the being of a single poet. Not only from one day or hour to another is there alternation of mood: his whole consciousness oscillates while his pen is poised in the air, and he deliberates an epithet.

This, then, is as much as is meant by saying that the poet now finds the material of his metaphorical creation 'in his own consciousness'. And if the two moods must for ever remain incompatible, there is nothing to prevent us looking forward to a time—to be brought in, let us say, by that excellent labour-saving device known to the nineteenth century as 'evolution', or even, faute de mieux, by the personal

THE POET

endeavour of poets themselves towards increased self-knowledge and self-control—when, to use a mathematical expression, the frequency of these oscillations may have increased to infinity; at which point at last the poet shall be creating out of full self-consciousness.
THE MAKING OF MEANING

we choose to call it so—lives on to some extent in the meanings of words, even after the other has begun to replace it; so that in any particular poem it is still a question of disentangling the two elements (cf. II, 3). And when we have done so, we shall find that, in the later kind of poetry, for which the individual poet is increasingly responsible—in which, as we saw, he has in certain respects to fight against language, making up the poetic deficit out of his private balance—in this kind it is perfectly true to call the poet the creator, or re-creator of meaning itself. For, if re-creation is strictly the more accurate term, yet creation, besides being established in current aesthetic terminology, is more truly fitted to the majesty of the idea. Surely no critic with enough metaphysical wit to be interested in the question at all would deny that ‘creation’, as an aesthetic term, signifies, not some fantastic ‘creation out of nothing’, but the bringing farther into consciousness of something which already exists as unconscious life. It is no disservice, then, to this frightfully abused word to emphasize its real connotation.

Now, apart from the actual invention of new words (an art in which many great poets have
POETIC DICTION

exceeded), the principal means by which this creation of meaning is achieved is—as has already been pointed out—metaphor. But it must be remembered that any specifically new use of a word or phrase is really a metaphor, since it attempts to arouse cognition of the unknown by suggestion from the known. I will take an example: the painter’s expression point of view was a metaphor the first time it was used (probably by Coleridge) with a psychological content. This content is to-day one of its accepted meanings—indeed, it is the most familiar one—but it could only have become so after passing, explicitly or implicitly, through the earlier stage of metaphor. In other words, either Coleridge or somebody else either said or thought (I am of course putting it a little crudely) ‘x is to the mind what point of view is to an observer of landscape’. And in so doing he enriched the content of the expression ‘point of view’ just as Shakespeare enriched the content of ‘balm’ (and of ‘sleep’, too) when he called sleep the ‘balm of hurt minds’ (‘sleep is to hurt minds what balm is to hurt bodies’). Reflection will show that the ‘new’ use of an epithet—that is to say, its application to a substantive with which it has not hitherto been coupled—is also a concealed metaphor.

In the present chapter I shall attempt to trace a single, predominantly ‘literary’ example of the continuous creation of meaning in the above sense.

2. English schoolboys are generally taught to translate the Latin verb ‘ruo’ by one of two words, rush or fall. And it does indeed ‘mean’ both these things; but, because it also means a great deal more, neither rendering alone is really an adequate equivalent. In the classical contexts themselves it nearly always carries with it a larger sense of swift, disastrous move-

1 Thus, when Blake wrote:

Then I made a rural pen
And I stained the water clear...

his cognitive act can be seen, in retrospect, to have contained implicitly the judgment: ‘These hitherto unapprehended attributes are to my pen what the attributes connoted by the epithet rural are to the objects to which that epithet is customarily applied.’

But to say that it contained this judgment implicitly is not to say that it was equivalent to this judgment. On the contrary; for logical judgments, by their nature, can only render more explicit some one part of a truth already implicit in their terms. But the poet makes the terms themselves. He does not make judgments, therefore; he only makes them possible—and only he makes them possible.
POETIC DICTION

The making of meaning came to be formed, it contained this last part only of the meaning of the verb—in other words, the older meaning, whether still wholly 'given' or containing by now a 'created' element, was now being further restricted, hardened, arrested, under the influence of the rational principle. And another change soon took place: it could now mean, not only the falling itself, but the thing fallen. It is like watching a physical process of crystallization.

Guy de Maupassant said somewhere: 'Les mots ont une âme; la plupart des lecteurs, et même des écrivains, ne leur demandent qu'un sens. Il faut trouver cette âme qui apparaît au contact d'autres mots...'. It will, I think, appear that this 'soul', latent in words, and waiting only to be discovered, is for the most part a kind of buried survival of the old 'given' meaning under later accretions; or, if not of the 'given' meaning itself, then of an old 'created' meaning which has been buried in the same way. For created meanings, once published, are as much subject, of course, to the binding, astringent action of the rational principle as the original given meanings. Like sleeping beauties, they lie there prone and rigid in the walls of Castle Logic, waiting only for

[112]
the kiss of Metaphor to awaken them to fresh life. That words lose their freshness through habit is a more humdrum way of saying the same thing; and it will do well enough, as long as we remember that ‘habit’ is itself only a familiar name for the repetition of the identical, and that the repetition of the identical is the very essence of the rational principle—the very means by which the concrete becomes abstract—the enchanter’s wand itself.

The words ‘au contact d’autres mots’ (which remind us of the tag from the *Ars Poetica*: ‘notum si callida verbum Reddiderit iunctura novum . . .’) are particularly important. For this ‘contact’ with other words is the precise point at which the potential new meaning originally enters language. And it is by quotations illustrating such ‘contacts’ that I am trying to trace the gradual loss of ancient meaning, given or created, from the word ‘ruin’, the recovery of part of it, and the positive gain which, thanks to individual poets, arises out of that sequence of loss and recovery.

In Latin, then, the four letters ‘r-u-i-n’ never lost the power to suggest *movement*. In certain contexts they may seem to modern readers to possess a purely static and material reference;

The making of meaning

but if so, it is because those readers are of the kind described by Maupassant as demanding only a ‘sens’, a definable meaning. The *soul* of such a word as ‘ruina’ is really inseparable from motion.

Si fractus illabatur orbis,
Impavidum serient ruinae

says Horace; the world is still falling when the stanza ends.

3. Before 1375 the word *ruin* with the meaning ‘a falling’ has come, via France, to England, and we find Chaucer using it in that sense. Thus, Saturn, in the *Knight’s Tale*, boasting of his powers, proclaims to Venus:

Min is the ruine of the highe halles,
The falling of the tores and of the walles.

Here is the word in poetic use, mobile and vigorous enough, but without its modern subtlety, because in English it has as yet no *solid* associations to give it weight and deepen its private significance. It is simply a useful Latin word. So, too, we may notice that Gower, about the same time, is employing the word almost in its exact classical sense:

The wal and al the cit withinne
Stant in ruine and in decas,
POETIC DICTION

where we should now say 'stand in ruins', and think at once, not of a process or a state (which is Gower's meaning) but of the actual fragments of masonry.\textsuperscript{1} 1454 is the date of the first recorded instance of plural use with a definitely material reference—ruins—and it is probable that by Spenser's time the meaning was quickly spreading over that special area which it was to cover during the eighteenth century. He writes, it is true:

The late ruin of proud Marinell,
meaning Marinell's disastrous defeat in battle, and uses the word twenty-one times in this older sense; but he also uses the modern plural thirteen times, and speaks of

The old ruins of a broken towre.

These two lines alone are enough to show that already, before the end of the sixteenth century, the English word, with the double set of associations which it was now beginning to acquire, had a 'soul'; though no one had quite found it; no one, that is, had realized it in consciousness. For it was not in the nature of English poetry before the seventeenth century

\textsuperscript{1} Cf. V, 2 and 3.

THE MAKING OF MEANING

to 'add' meaning to words in this way, by evoking their hidden reality. Thus, Spenser, who made all English into a language of his own, half-creating in his poesy another Spenserian world, which never quite touches the real one, gave little of permanence to language. As creator of language, Spenser was fantastic rather than imaginative.\textsuperscript{1}

4. By this time, however, English meaning had suddenly begun to ferment and bubble furiously round about a brain in a Stratford cottage; witness the sheer verbal exuberance of Love's Labour's Lost. Many and many of its words were to suffer an extraordinary change before the century was out, however slowly that change might become apparent. In some cases the new energy in them was not to be released until the nineteenth century—even later. But the energy was there. There is a new English Dictionary hidden between the pages—or is it between the lines?—of the First Folio. Shakespeare stands supreme over the other poets of the world in the one great quality of abundant life; and this he gave to

\textsuperscript{1} He seems, however, to have invented the useful epithet, blatant, though he himself never employed it outside the conventional title of the 'Blatant Beast'.

[116]
POETIC DICTION

words, as he gave it to Falstaff and Sir Andrew Aguecheek. He made more new words than any other English writer—but he also made new meanings. We are at present concerned only with the word ruin; let us listen, then, to Salisbury’s words, when he is confronted with Arthur’s body lying huddled on the stones, where the fall has killed him:

It is the shameful work of Hubert’s hand,
The practice and the purpose of the King;
From whose obedience I forbid my soul,
Kneeling before this ruin of sweet life . . .

‘Les mots ont une âme . . .’ No synonym would do here; the phrase

Kneeling before this ruin of sweet life is one—a tiny work of art. In Spenser’s line

The late ruin of proud Marinell

you could substitute fall or disaster, if the syllables would scan. But Shakespeare has felt the exact, whole significance of his word. The dead boy has fallen from the walls; the sweet life, which was in him too, has crumbled away; but wait—by Shakespeare’s time the word was beginning to acquire its other meaning of the actual remains—and there is the shattered body

THE MAKING OF MEANING

lying on the ground! He has, indeed, found a soul in the word.

It seems to have been one which appealed dearly to his imagination, for we find the transitive verb in one of the loveliest lines from the sonnets:

That time of year thou may’st in me behold
When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold,
Bare ruin’d chairs, where late the sweet birds sang.

But it was in Antony and Cleopatra, near the end of his work, that he made the boldest stroke of all, writing quietly but magnificently:

The noble ruin of her magic, Antony.

There is a new word. Yet Shakespeare had not done it all with his own hands. The transitive verb ‘to ruin’ had been invented already, by 1585, before he started to write, and, without the new habit of thought which this use of them was forming in himself and in his hearers, he could not have used the four letters passively with such effect. For a poet must take his words as he finds them, and his readers must not realize too acutely that fresh meaning is being thrust upon them. The new meaning must be strange, not incomprehen-
POETIC DICTION

sible; otherwise the poetry of the whole passage is killed, and the fresh meaning itself will be still-born.

5. The word ruin, then, has grown with Shakespeare's help into a warm and living thing, a rich piece of imaginative material ready at hand for anyone who has the skill to evoke its power. Now, early in the seventeenth century, it had been used for the first time as an intransitive verb, taking the place once and for all of an older verb, to rue, which had the same meaning, but never probably (since it had not been used by the poets) the same suggestive power. Grimstone, in a History of the Siege of Ostend (1604), wrote: 'They suffered it to burn and ruin'; while Sandys, in a verse paraphrase (!) of Job, has:

Though he his House of polished marble build,
Yet shall it ruine like the Moth's frail cell.

It was natural that Milton, with his bookish sense of the philological history of his words, should come forward to perpetuate this use. To the noun ruin he added nothing; what he did was to help 'fix' its Latinity by never once using it in its modern material sense. So that when Satan

yet shone, majestic though in Ruin,

[120]

THE MAKING OF MEANING

he exerted only a negative, if deepening, influence on the history of the word. It is the terrific phrase:

Hell heard the insufferable noise, Hell saw
Heaven ruining from Heaven

which is important. For it is preserving that old content of large and disastrous movement, which Wordsworth, Milton's devout disciple, has finally recovered for us into the language.

But there is all the eighteenth century in between; and during that time ruin, like most words other than domestic and civic and scientific terms, seems to have possessed a greatly diminished power of suggestion. These latter words, of course, grew. Pope, for instance, found out a kind of soul in the word engine, when he used it in the Rape of the Lock of a pair of scissors:

He takes the gift with reverence, and extends
The little engine on his fingers' ends.

But the others—especially those purporting to be descriptive of Nature—must have felt uncomfortably stifled, and many of them, as we have seen, actually lost much of their poetic vitality. The question was, in each case, whether any poet would arise to restore it.

[121]
POETIC DICTION

Dryden wrote:

So Helen wept, when her too faithful glass
Reflected to her eyes the ruins of her face.

But after that, until the coming of Wordsworth, it is all tumbledown walls and mossy masonry. We can just imagine how solid an idea must have been imprinted by the word ruins on an eighteenth-century imagination, and how faintly its original force must have survived, when we recollect that it was not unknown for an eighteenth-century gentleman to erect an irregular building in his grounds, train moss to grow upon it, and dub it by that lively name! In this connexion Dryden’s own use of the plural rather than the singular is interesting, as emphasizing the solid, material reference of the meaning. Indeed, I believe that to his own fancy, as well as to those of many of his readers, the phrase was actually an ‘accidental’ metaphor in which the unfortunate lady’s face was compared to the ‘picturesque’ remains of a Gothic abbey.

6. All this suggests a feature, to which attention has not yet been drawn, in the history of Poetic Diction, or rather in the parallel

1 See Appendix III.

THE MAKING OF MEANING

history of that anti-poetic process, which I have ventured to describe as the ‘splitting up’ of meaning, and which accompanies the natural decline of language into abstraction. It is this, that under certain circumstances, poets themselves may assist that process. Thus, the first time ruin was used alone with a blunt and, as it were, purely material, meaning, that use of it may have been original and poetic. The first man who looked at the ruin of a wall and called it simply a ruin may well have had the true dramatic-poetic sense of the value of omission, with its accompanying phenomenon of suggestion. It was this kind of omission, presumably, which gave to bade its dark prophetic significance. Just as the poetry of to-day, then, may have been but the normal language of yesterday, so, much that appears in the light of subsequent development to have been really, by its proper nature, in the prosaic stream, may yet have been true poetry to the experience of contemporaries. During the eighteenth century itself there may well have been a romance and a flavour clinging to their own favourite use of the word ruin—a romance not quite so false and a flavour not quite so insipid as we must think, whose
POETIC DICTION

only understanding of those different minds is derived from a language which has also changed.

7. There is no need to quote from the foremost poet of the eighteenth century. He made no uncommon use of the word, nor added much to its power. Nor did anyone else. Nevertheless the word means more than it did before the powdered wigs and flowered waistcoats had come and gone; for, from now on, it is irradiated with some of the massive quiet of deserted Gothic masonry. And no matter how many times it has been carelessly handled for the purposes of false and facile romanticism, the old romance will always be ready to flash out to a touch of true imagination.

So time passed. Young, it is true, had felt the quality of the word, and there may be other isolated examples. In the second book of the Night Thoughts the father is describing the appearance of his dead daughter lying stretched upon her bed:

   Lovely in death the beauteous ruin lay.

It is a definite echo, I think, of the line from King John—a dying echo—and with Gray the soul of the word finally runs to seed in the

THE MAKING OF MEANING

fanciful, allegorical, synthetic dullness of actual personification:

   Ruin seize thee, ruthless King!

Then came Wordsworth, who immediately, in one of his earliest poems, The Descriptive Sketches, got a move, as it were, on the word and dislodged it from its sentimental repose. He used it of an avalanche:

   From age to age throughout his lonely bounds
   The crash of ruin fitfully resounds.

And the verb neuter of a waterfall:

   Ruining from the cliffs the deafening load
   Tumbles.

We are back again now with Milton. Wordsworth has gone to the other extreme, and both these uses are a little too near to the word’s simplest etymological significance, are not new enough to be very striking; yet doubtless at the time when they were written they had the power to startle such minds as were really alive to the signs of the times, and to set them dreaming new dreams. They are a clear enough symptom of that general quickening of perception which found its expression in the Romantic Revival. Hundreds of dead words
POETIC DICTION

might be resuscitated by men like Bishop Percy and Sir Walter Scott; it was the task of even more vital spirits to awaken those that were only sleeping.

It is doubtful whether Tennyson or Browning have added much—or perhaps it is too early to say. On the whole, Tennyson's tendency is to abstract the meaning from reality and semi-personify it:

When the crimson rolling eye
Glares ruin!

And again:

The Sea roars Ruin. A fearful night!

Note the capital letter. And yet, in Lucretius, there is that one magnificent example of the verb neuter:

A void was made in Nature; all her bonds
Crack'd; and I saw the flaring atom-streams
And torrents of her myriad universe,
Ruin ing along the illimitable inane . . .

8. Here, then, is the modern word ruin—a piece of many lost minds—waiting, like all the other words in the dictionary, to be kindled into life by a living one; and nothing more is necessary than to surround it with other words (the right ones) from the same museum. Is

THE MAKING OF MEANING

this being done at all in contemporary verse? There is one line at least, written by a modern poet, which must be quoted. Some time ago, when I had finished reading a volume of verse by Mr. E. L. Davison, two passages remained to haunt me. Both of them contained the word ruin, and it was, as a matter of fact, this coincidence which first interested me in the word's poetic history. The first is not significant, except as indicating that this particular word tends to rise to the surface of this poet's memory, when it is disturbed by delightful images. It is from a poem called The Sunken City:

... the climbing tentacles
Of some sleep-swimming octopus
Disturb a ruined temple's bells
And set the deep sea clamorous.

Thus, the very choice of subject suggests that his imagination is one which is attracted by the somewhat dangerous beauty of 'ruin'. So we find. Take these two lines from a love-sonnet in the same volume:

I stood before thee, calling twice or thrice
The ruin of thy soft, bewildering name.

The whole sonnet is not, as I think, an exceptionally good one, but in poetry there is
POETIC DICTION

always, moreover, this loveliness of the individual line, of the sentence which haunts and startles and waylays, building and beautifying the language, making new mind. And this line seems in a way to be a summing up of all previous poetic uses of the word, and then a step beyond them: read it: ‘ruin’ showers noiselessly over it in a kind of dream-waterfall of forgotten pangs.

In this chapter, I have taken only one English word, and one no richer in itself than a thousand others. Yet it serves well enough to show how the man of to-day, overburdened with self-consciousness, lonely, insulated from Reality by his shadowy, abstract thoughts, and ever on the verge of the awful maelstrom of his own fantastic dreams, has among his other compensations these lovely ancestral words, embalming the souls of many poets dead and gone and the souls of many common men. If he is a poet, he may rise for a moment on Shakespeare’s shoulders—if he is a lover, then, certainly, there are no more philtres, but he has his four magical black squiggles, wherein the past is bottled, like an Arabian Genie, in the dark. Let him only find the secret, and there, lying on the page, their printed silence
THE MAKING OF MEANING (II)

1. A very little practice in this method of concentration on the meaning of the single word will convince anyone who cares to try it of the insight which it brings into the beating heart of poetry. Nevertheless hardly any criticism along such lines has been attempted. As far as I know, Goldsmith’s essay on Poetry, as Distinguished from Other Writing is practically the first and last of its kind in English. In this essay Goldsmith took (among some other words) the Latin verb pendere, first quoting the observation of a previous critic that Virgil had frequently ‘poetized’ a whole sentence by means of the same word. He cited:

\[ Ita meae, felix quondam pecus, ita capellae, \\
Non ego vos posthaec, viridi projectus in antro, \\
Dumosa pendere procul de rupe videbo. \]

[130]

THE MAKING OF MEANING

and

Hi summo in fluctu pendet, his unda dehiscens
Terram inter fluctus apertis;

And, again, the description of Dido listening to Æneas:

Iliacos iterum demens audire labores
Exposit, pendetque iterum narrantis ab ore.

And he went on to show how the English poets have carried on, or repeated, these delicate uses, quoting Shakespeare’s

half way down

Hangs one that gathers samphire—dreadful trade!

Milton’s description of Adam:

he, on his side,
Leaning half-raised, with looks of cordial love
Hung over her enamoured.

And Addison’s

Thy providence my life sustained,
And all my wants redressed,
When in the silent womb I lay,
And hung upon the breast.

2. Goldsmith, however, said nothing of the light which this kind of criticism can be made to throw on the genius of the individual poet; and that is one of its most significant uses. At
POETIC DICTION

the same time, it is much harder to exemplify; for its delicacy is apt to be lost in any attempt to restrain it within the strait-jacket of a prose description. It is rather for the reader himself to be ready to pull up and ponder when he is struck by a peculiar meaning. The author of a little book called Milton and Metaphysics, which appeared a few years ago, gave evidence that he had learnt some of Coleridge's secrets by pausing in just this way on his distinctive uses of the word quiet; and Mr. Bonamy Dobrée, in his Literary Biographies, had a delightful appendix on Addison's curious love of secret.

One can readily find other examples. To allow oneself, for instance, to experience to the full the wealth of meaning which the little epithet trim contained for Milton, is to see the world through his eyes in a specially intimate way. From Samson Agonistes we see that he is aware of its nautical tang; for we find it in that wonderful description of Dalilah's approach:

But who is this, what thing of Sea or Land?
Female of sex it seems,
That so bedeckt, ornate, and gay,
Comes this way sailing

[132]

THE MAKING OF MEANING

Like a stately Ship
Of Tarsus, bound for th'Isles
Of Jawan or Gadier
With all her bravery on, and tackle trim,
Sails fill'd, and streamers waving . . . .

It is the same whiff of fastidious tidiness, blown ashore, as it were, from some little cabin on the high seas, which gives to the 'trim gardens' of Il Penseroso their peculiar character:

And add to these retired Leasure,
That in trim gardens takes his pleasure;

We can almost feel the spotless linen of the dainty young scholar—demure without being effeminate—who is walking in them. And how specifically Miltonic is that landscape in l'Allegro—the unforgettable

Meadows trim, with daisies pied.

Or again, anyone who will trouble to get out a Shakespeare Concordance and dwell imaginatively on the number and variety of Shakespeare's uses of the word function (which is not found in our language at all until about fifty years before he began to write) cannot, I believe, fail to feel, with a new amazement, the creative working of his genius, and to feel it, not merely by inference from its results,
POETIC DICTION

but as taking a kind of part in the very process.

3. The coining of new words, as far as it is certainly attributable, is also a factor of some importance. That Shakespeare should apparently be the father of such everyday English words as pedant, critic, majestic, etc.; Dryden of the adjectives mawkish and correct; Coleridge of pessimism, Elizabethan, dynamic, self-conscious—even that Lord Chesterfield gave us parsonical—all this is interesting not only critically but historically. It is interesting critically, when we notice the kind of word which this or that writer tends to create; historically, when we go on to consider how far any such word, as an embodiment of new meaning, was a substantial gift to the general consciousness. But I fancy it is easy to exaggerate the importance of these phenomena. They are more often etymological than semantic, and one must not, in the delight of finding something rather more tangible than the elusive ‘change of meaning’, allow oneself to forget that their significance is often little more than anecdotal. Meaning is everything. When we can experience a change of meaning—a new meaning—there we may really join hands and sing with the morning.

THE MAKING OF MEANING

stars; for there we are in at the birth. There is one of the exact points at which the genius, the originality, of the individual poet has first entered the world.

4. The objection will possibly be raised that this dwelling upon the meanings of individual words is a precious and dilettante kind of criticism. But, as a matter of fact (sententious as it must sound) the reverse is the truth. Words whose meanings are relatively fixed and established, words which can be defined—words, that is, which are used with precisely the same connotation by different speakers—are results, they are things become. The arrangement and re-arrangement of such univocal terms in a series of propositions is the function of logic, whose object is elucidation, and the elimination of error. The poetic has nothing to do with this. It can only manifest itself as fresh meaning; it operates essentially within the individual term, which it creates and recreates by the magic of new combinations. Horace chose his junctura, and Maupassant his contact, well: for in the pure heat of poetic expression juxtaposition is far more important than either logic or grammar. Thus, the poet’s relation to terms is that of
POETIC DICTION

maker.\footnote{The use of them is left to the Logician, who, in his
effort to keep them steady and thus fit them to his
laws, is continually seeking to reduce their meaning. I say
seeking to do so, because logic is essentially a compromise.
He could only evolve a language whose propositions would
really obey the laws of thought by eliminating meaning
altogether. But he compromises before this zero-point is
reached. See also VII, 1, note.} And it is in this making of terms—
whether the results are to be durable or fleeting —that we can divine the very poetic itself.
When we strive to contemplate the genesis of
meaning—to be one with the poet, as it were,
while the term is still uncreate—then we have
descended with Faust into the realm of the
Mothers; then we are drinking of the springs
and fashions of Becoming.

Surely, if criticism is anything worth while,
it must be a sort of midwifery—not, of course,
in the Socratic sense, but retrospectively. It
must try to alter the state of mind of the artist’s
audience, from mere wondering contemplation
of an inexplicable result, towards something
more like sympathetic participation in a
process. And in poetry, as far as it is merely
semantic, and not dramatic, or sentimental, or
musical—this process is the making of meaning.
What kind of criticism, then, is dilettante:

THE MAKING OF MEANING

that which attempts to know, by sharing in,
the poetic process itself, or the fastidious sort
which can only moon aimlessly about the room
with its hands in its pockets, till the infant is
nicely washed and dried and ready for inspec-
tion?

There is really no end to the secrets hidden
behind the meanings of single words—though
I do not suggest that meditation on such
meanings is the only way to come by them.
Nevertheless, wherever two consciousnesses
differ, as it were, in kind, and not merely in
relative lucidity—there the problem of sym-
pathy can always be narrowed down to the
problem of the meaning of some one or more
fundamental words. One of the most striking
examples of this truth is the interpretation
of Greek philosophy by modern Europeans.
Such an one can read Plato and Aristotle
through from end to end, he can even write
books expounding their philosophy, and all
without understanding a single sentence. Un-
less he has enough imagination, and enough
power of detachment from the established
meanings or thought-forms of his own civiliza-
tion, to enable him to grasp the meanings of
the fundamental terms—unless, in fact, he has

[136]

[137]
POETIC DICTION

the power not only of thinking, but of un-

thinking—he will simply re-interpret every-

thing they say in terms of subsequent thought.

If he merely seeks to deduce the meaning of

words like ἄγχος, λόγος, γίγαντας, ἔρημος, ὁμάς,

etc., from the general context, if he cannot

rather feel the way in which they came into

being out of the essential nature of the Greek

consciousness as a whole, he may read pages and

pages of Greek letterpress, and enjoy them,

but he will know no more than the shadow of

Greek meaning. One could add many other

words, but it would take us too far afield.

Spengler is excellent on the untranslatableness of

these root-words, as he calls them, and in

insisting on the consequently unbridgeable gap

between the souls of any two great cultures.

But if these words are really quite untransla-
table, if the gulf is truly unbridgeable, it will
be said—what is the use of talking about them?
The answer to this is that the meaning of such
words—like all strange meaning—while not
expressible in definitions and the like (the
prosaic), is indirectly expressible in metaphor
and simile (the poetic). That is to say, it is
suggestible; for meaning itself can never be

conveyed from one person to another; words are

THE MAKING OF MEANING

not bottles; every individual must intuit mean-
ing for himself, and the function of the poetic
is to mediate such intuition by suitable sugges-
tion.

A book appeared recently called The Meaning
of Meaning. The authors of this work wrote
on page 5 (in a brief critique of M. Bréal's
Semantics) that 'it is impossible thus to handle
a scientific matter in metaphorical terms'. The
reader is thus confronted with a long and clever
book on Meaning, the authors of which have
never managed to grasp its essential feature—
the relation to metaphor. How did this come
about? The book would certainly never have
been written, if they had started their
theory of Meaning from the only possible
starting-point—the meaningless. But, instead
of this, they have taken as jumping-off place
one particular, highly elaborated system of
meanings, which they apparently regard as
being in some way fundamental. The book is
thus a painful example of the lack of just that
power of detachment from the thought-forms of
a particular civilization, to which I have
referred. The authors of The Meaning of
Meaning have never practised the gentle art
of unthinking, though it is one for which the
POETIC DICTION

subtlety and agility of their intellects must, as a matter of fact, make them peculiarly fitted. As a result, they are absolutely rigid under the spell of those verbal ghosts of the physical sciences, which today make up practically the whole meaning-system of so many European minds. This may seem a strong expression; yet surely nothing but a kind of enchantment could have prevented two intelligent people who had succeeded in writing a treatise some four hundred pages long on the 'meaning of meaning', from realizing that linguistic symbols have a figurative origin; a rule from which high-sounding 'scientific' terms like cause, reference, organism, stimulus, etc., are not miraculously exempt! That those who profess to eschew figurative expressions are really confining themselves to one very old kind of figure, might well escape the ordinary psychological or historical writer; it usually does; that it should escape the specialist in Meaning is somehow horribly tragic. And indeed the book is a ghastly tissue of empty abstractions.

5. It will be remembered that, as I am using the terms, a word has a 'figurative' origin in so far as its meaning is 'given' in the sense deve-

THE MAKING OF MEANING

loped in IV, 3 and VI, 1; a 'metaphorical' origin, in so far as its meaning is the product of the inventive constructions of individuals. Now a great deal—perhaps most—of the technical vocabulary of philosophy and science can be shown to be not merely figurative, but actually metaphorical.

It will also be plain by this time that I have been using the word 'poet' in the wide sense beloved of the Romantics—the sense in which, as Shelley put it, 'Plato was a poet, Lord Bacon was a poet'. The literary justification of this use will be considered in the next chapter. Before passing on, however, it may be useful to point to some groups of common words, in which this 'making of meaning' is historically perceptible and has indeed had effects reaching far outside the domain of literature.

Coleridge's point of view has already been cited. His novel use of the word imagination—distinguishing it from fancy—is another example of the introduction of fresh meaning into the English language. Similarly, a careful study of Shakespeare reveals him as the probable author of a great part of the modern meanings of several words which are practically key-terms to whole areas of typical modern thought
POETIC DICTION

—especially to those parts of it which are peculiarly the discovery of English thinkers. He was, for example, as far as is known to the compilers of the Oxford Dictionary, the first person to use function of a physical organ, and the first person to use inherit, not of property, but of moral or physical qualities.  
Nerve meant a sinew or tendon, or, metaphorically, strength, before he employed it in its modern physical sense; and the word voluntary is not known to have been applied to human actions—except with a definite connotation of moral disapproval—until it was so applied in Shakespeare's works. He is also the first writer quoted in the Oxford Dictionary as applying the words create, adore, religion, magic, to other than avowedly supernatural or (in the case of adore) royal, subjects.

These are only a few examples of the effect of Shakespeare's genius on what I ventured to call in the last chapter 'English meaning'. Exactly how far it has reverberated outside England into modern consciousness as a whole is a question into which I cannot enter here. But no one with any delicacy of historical

THE MAKING OF MEANING

insight can fail to connect much in the consciousness—outlook—experience of life, or whatever we choose to call it—of modern Europe as a whole with, for instance, that change of attitude which is reflected in the transfer of Latin-French devotional words such as anguish, bounty, mercy, comfort, compassion, devotion, grace, passion, etc., to secular contexts. This transference can actually be watched in the development of medieval verse, until the new attitude receives its final expressive stamp at the hands of the Elizabethans. Oscar Wilde's not—that men are made by books rather than books by men—was certainly not pure nonsense; there is a very real sense, humiliating as it may seem, in which what we generally venture to call our feelings are really Shakespeare's 'meaning'.

It would be possible to carry these considerations farther back—to enquire, for example, how far the meanings of such metaphysical key-words as absolute, cause, concept, essence, intuition, potential, matter, form, objective, subjective, ideal, general, special, individual, universal, are merely figurative, and how far they are metaphorical in the sense of having been contributed by individual philosophers whether

[142]

[143]
POETIC DICTION

Greek, medieval, or modern. In some cases a radical change can be detected in quite recent times. *Subjective*, from signifying "existing in itself" came during the seventeenth century to signify "existing only in human consciousness".¹

Again, that expression of nature as a system of laws, which is commonly implied to-day when the word 'science' is used, has played its vital part in the development of modern meaning. And owing to the necessarily ² late period at which the possibility of seeing nature in this light arises, it may safely be said that all meanings of this kind are metaphorical rather than figurative. In many cases the original metaphorical use can be quite probably identified. Thus, it would seem that we owe to Bacon the application of *mechanical* to natural principles. The important change of meaning introduced about Newton's time into the words *gravity* and *gravitation*, which had previously meant 'weight' and 'falling', will be familiar to

¹ For a detailed scrutiny of the history of these terms the reader is referred to Rudolf Eucken's *Geschichte der Philosophischen Terminologie*. A more general and superficial survey of semantic development has been attempted in the author's *History in English Words*.

² Because it demands an advanced stage of self-consciousness, and is in general a characteristic of the prosaic.

THE MAKING OF MEANING

everyone. And Kepler's metaphorical use of the Latin *focus* (a hearth) in a geometrical context, and its subsequent introduction into the English language by Hobbes must mark an important step in the development of that modern *relational* mathematics, which Spengler has shown so convincingly to be a peculiar manifestation of Western consciousness, and which has had such important results outside of mathematics. To his book, and to the Appendices at the end of this one, I would refer those who may object that what I am calling 'the development of meaning' is simply a confusing name for the discovery of fact.

6. When we start explaining the language of famous scientists as examples of 'poetic diction', it may well seem that the ordinary meaning of that literary phrase has been inflated beyond the bounds of reason. Nevertheless such an extension was necessary, in order to make clear its real nature. Nor has it been waste of time, if it has convinced a single person who needed convincing, how essentially parochial is the fashionable distinction between Poetry and Science as modes of experience.

It has already been emphasized that the rational principle must be strongly developed

[144]

[145]
**POETIC DICTION**

in the great poet. Is it necessary to add to this that the scientist, if he has 'discovered' anything, must also have discovered it by the right interaction of the rational and poetic principles? Really, there is no distinction between Poetry and Science, as kinds of knowing, at all. There is only a distinction between bad poetry and bad science. That the two or three experimental sciences, and the two or three hundred specialized lines of enquiry which ape their methods, should have developed the rational out of all proportion to the poetic is, indeed, an historical fact—and a fact of great importance to a consideration of the last four hundred years of European history. But to imagine that this tells us anything about the nature of knowledge; to speak of method as though it were a way of knowing instead of a way of testing, this is—instead of looking dispassionately at the historical fact—to wear it like a pair of blinkers.

If we must have a fundamental dichotomy, how much more real it is (though even this is properly a division of function rather than of person) to divide man as knower from man in his other capacity as doer. Then, as knower, we shall find that he always knows by the interaction within himself of these poetic (ποιητικὴ) and logistic principles; and so we can divide him again, according to which of the principles predominates. If the poetic is unduly ascendant, behold the mystic or the madman, unable to grasp the reality of percepts at all—a being still resting, as it were, in the bosom of gods or demons—not yet man, man in the fullness of his stature, at all. But if the passive, logistic, prosaic principle predominates, then the man becomes—what? the collector, the man who cannot grasp the reality of anything but percepts. And here at last a real distinction between poet and scientist, or rather between poetaster and pedant, does arise. For if the 'collector's' interests happen to be artistic or literary, he will become the connoisseur, that is, he will collect either objets d'art or elegant sensations and memories. But if they are 'scientific', he will collect—data; will, in fact, probably go on doing so all his life, to the tune of solemn warnings against the formation of 'premature syntheses'.

That the idea of Poetry and Science as two fundamentally opposite modes of experiencing Life should have taken firm hold of a generation which honours Aristotle, Bacon and...
Poetic Diction

Goethe, will I believe, be as much a matter of wonder to our posterity as it will—if not re-adjusted—be a matter of tragedy to ourselves. This is not the place to consider the effects of such an attitude on ordinary research, except as that can be seen through its effects on art. Alas, the latter are already palpable. For it leads straight to that Crocean conception of art as meaningless emotion—as personal emotion symbolized—which is so poisonous in its charter to all kinds of posturing and conceited egotism. No reflection is intended on Croce himself, whose works possess an extraordinarily selfless dignity; but that does not alter the fact that the spread of such a conception is a serious matter for a civilization which must look more and more to art—to the individualized poetic as the very source and fountain-head of all meaning.

7. Provided, then, that we do not look too far back into the past (i.e. beyond the point at which the ‘given’ meaning of a word first began to yield place to the ‘created’ meaning) language does indeed appear historically as an endless process of metaphor transforming itself into meaning. Seeking for material in which to incarnate its last inspiration, imagination

The Making of Meaning

seizes on a suitable word or phrase, uses it as a metaphor, and so creates a meaning. The progress is from Meaning, through inspiration to imagination, and from imagination, through metaphor, to meaning; inspiration grasping the hitherto unapprehended, and imagination relating it to the already known.

Now it has been pointed out by others before this that there is no other way by which real knowledge of Nature can spread and increase—by which the consciousness of humanity can actually be enlarged, and knowledge, which is at present new and private, made public, but some form of metaphor. Bacon himself, than whom no one can ever have been more alive to the dangers of a vague and misty imagery (the very idola theatri which he had set out to smash), took the trouble to say so in the Advancement of Learning:

1 [148] 1 II, xvii. 10. Aristotle too, however, when he came to think on the subject of poetry, seems to have realized the epistemological significance of metaphor. For he says in the Poetics: πολύ μέριστον τὸ μεταφορικόν. μόνον γάρ τούτῳ οὔτε ποι’ ὅλου ἔστι λαβεῖν εἴκοσι τε σημείων ἐστί. τὸ γάρ εὖ μεταφέρειν τὸ τῷ ύμου θεορεῖν ἐστίν.

The making of metaphors is by far the most important; since this alone does not involve borrowing from somebody else and is [therefore] a mark of genius; for to make a good metaphor is to contemplate likeness.

[149]
POETIC DICTION

For that knowledge which is new, and foreign from opinions received, is to be delivered in another form than that that is agreeable and familiar; and therefore Aristotle, when he thinks to tax Democritus, doth in truth commend him, where he saith, If we shall indeed dispute, and not follow after similitudes, etc. For those whose conceits are seated in popular opinions, need only but to prove or dispute; but those whose conceits are beyond popular opinions, have a double labour: the one to make themselves conceived, and the other to prove and demonstrate. So that it is of necessity with them to have recourse to similitudes and translations to express themselves. And therefore in the infancy of learning, and in rude times, when those conceits which are now trivial were then new, the world was full of parables and similitudes.'

So also, to-day, Professor Baldwin in his Thought and Things, points out how

the development of thought ... is by a method essentially of trial and error, of experimentation, of the use of meanings as worth more than they are at yet recognized to be worth.

\[150\]

THE MAKING OF MEANING

The individual must use his own thoughts, his established knowledges, his grounded judgments, for the embodiment of his new inventive constructions. He erects his thought as we say "schematically" ... projecting into the world an opinion still peculiar to himself, as if it were true. Thus all discovery proceeds.'

Indeed, it was just their clear, even delighted, vision of this truth, which misled the more imaginative philologists into the errors I discussed in the chapter on Metaphor. So dazzled were they, that they fancied the same process must needs be true of all poetry, of all language, of all time. They failed to distinguish the poetic from the individualized poet: they did not see that the creation of metaphor can only be predicated of a community in which the prosaic is already flourishing. Yet it is only by means of this prosaic spirit that the separate perceptual groups ('phenomena'), which metaphor is to combine or relate, could ever have become separate. Moreover, it is only by means of this same principle that the individual consciousnesses, which are assumed to have done the creating, could ever have come into being. For the rational principle, the to logizew, is
POETIC DICTION

above all that which produces self-consciousness. It shuts off the human ego from the living meaning in the outer world, which it is for ever 'murdering to dissect,' and encloses that same ego in the network of its own, now abstract, thoughts. And it is just in the course of that very shutting off that the ego itself stirs and awakes to conscious existence.

Yet, having awoken, it is as helpless as any other new-born thing without the life of the mother-Nature from which it sprang. Let the weaning be followed too soon by separation, and the wailing creature perishes of cold. Such a separation, a separation of consciousness from the real world, is today only too conspicuous alike in philosophy, science, literature, and normal experience. Isolated thus, suspended, as it were, in vacuo, and hermetically sealed from truth and life, not only the proper name, but the very ego itself, of which that is but the symbol, pines and dwindles away before our eyes to a thin nothing—a mere inductive abstraction from tabulated card-indexed behaviour, whose causes lie elsewhere. There is an awful word—'behaviourism'... Nor is there any remedy for this state of affairs but that experience of truth, or identification of the

THE MAKING OF MEANING

self with the meaning of Life, which is both poetry and knowledge.

Now, although, without the rational principle, neither truth nor knowledge could ever have been, but only Life itself, yet that principle alone cannot add one iota to knowledge. It can clear up obscurities, it can measure and enumerate with greater and ever greater precision, it can preserve us in the dignity and responsibility of our individual existences. But in no sense can it be said (cf. II, 5 and 6) to expand consciousness. Only the poetic can do this: only poesy, pouring into language its creative intuitions, can preserve its living meaning and prevent it from crystallizing into a kind of algebra. 'If it were not for the Poetic or Prophetic character,' wrote William Blake, 'the philosophic and experimental would soon be at the ratio of all things, and stand still, unable to do other than repeat the same dull round.' Like some others of the mystics, he had grasped without much difficulty the essential nature of meaning. For all meaning flows from the creative principle, the to poiein, whether it lives on, as given and remembered, or is re-introduced by the individualized creative faculty, the analogy-perceiving, metaphor-
POETIC DICTION

making imagination. In Platonic terms, we should say that the rational principle can increase understanding, and it can increase true opinion, but it can never increase Knowledge. And herein is revealed the levity of chanting with too indiscriminate praises the triumphal 'progress' of our language from Europe to Cathay.

VERSE AND PROSE

1. At the opposite pole to the wide sense in which I have been using the phrase 'poetic diction', stands the narrowest one, according to which it signifies 'language which can be used in verse but not in prose'. This artificial identification of the words poetry and poetic with metrical form is certainly of long standing in popular use; but it has rarely been supported by those who have written on the subject.¹ As Verse is an excellent word for metrical writing of all kinds, whether poetic or unpoetic, and Prose for un-metrical writings, in this book the formal literary distinction is drawn between verse and prose; whereas that between poetry, poetic on the one hand and prosaic on the other is a spiritual one, not confined to literature. The meanings which I attach to these latter words should already be fairly clear from the

¹ Hegel, in his Philosophy of Fine Art, makes a notable exception.
POETIC DICTION

foregoing chapters. I will, however, add four definite examples:

(i) On the roof
    Of an itinerant vehicle I sate
    With vulgar men about me . . .

is verse, and at the same time prosaic.

(ii) The crows and choughs that wing the midway air
    Show scarce so gross as beetles; half way down
    Hangs one that gathers sapphire, dreadful trade!
    Methinks he seems no bigger than his head.

is verse and at the same time poetry.

(iii) I told the butcher to leave two and a half pounds of
    best topside.

is prose and at the same time prosaic.

(iv) Behold now this vast city, a city of refuge . . .
    (Example vi)

is prose and at the same time poetry or poetic.

But if those writers who have seriously set out to discuss and define poetry have very rarely made metre their criterion, yet, for historical reasons, most of the poetry with which they have actually had to deal has, in fact, been in metrical form; and it is this, in all probability, which has given rise to the terminological confusion.

All literatures are, in their infancy, metrical,

VERSE AND PROSE

that is to say, based on a more or less regularly recurring rhythm. Thus, unless we wish to indulge all sorts of fanciful and highly 'logomorphical notions, we are obliged to assume that the earliest verse-rhythms were 'given' by Nature in the same way as the earliest meanings. And this is comprehensible enough. Nature herself is perpetually rhythmic. Just as the myths still live on a ghostly life, as fables after they have died as real meaning, so the old rhythmic consciousness of Nature (it should rather be called a participation than a consciousness) lives on as the tradition of metrical form. We can only understand the origin of metre by going back to the ages when men were conscious, not merely in their heads, but in the beating of their hearts and the pulsing of their blood—when thinking was not merely of Nature, but was Nature herself.

It is only at a later stage that prose (= not-verse) comes naturally into being out of the growth of that rational principle which, with its sense-bound abstract thoughts, divorces man's consciousness from the life of Nature.

1 e.g. That, before the invention of writing, metrical form was deliberately adopted as an aid to memory.

2 Cf. IV, 1.
POETIC DICTION

In our own language, for example, it is only during the last three centuries that there has grown up any considerable body of prose, on which the critic could work. Consequently, the derivation from prose (= not-verse) of the adjective proseic (= not-poetic) is not accidental. On the contrary, it is a record of certain historical facts. And yet we are wrong if we deduce from it the apparently logical conclusion that not-verse = not-poetry. Why? The question can only be answered historically, and in connexion with other questions, such as that which has just been discussed, of the responsibility of individuals for poetic values.

2. The time at which the prose form (or lack of form) first begins to be used as a vehicle for imaginative writing in any particular language would indeed call for a full treatment in the poet's history of language which I envisaged above. Such a history would no doubt consider to what extent it tended to coincide with that period of a balance, as it were, between the two principles, which seems to make a language ripe for the appearance of its great poet—the period when Italy produces her Dante, England her Shakespeare.¹ I do not myself feel competent to carry this enquiry further than to point out that in this country—though Malory had written poetic prose a century before—it was, in fact, shortly before the time of Shakespeare that serious experiments were first made with prose as an imaginative medium.

Certainly it could be shown, without difficulty, and from many different sides, how the rise of prose, whatever else it may signify, is a necessary event in the biography of a language developing along the lines traced out above. For instance, the increasing fixity of word-order has already been referred to, and this is obviously a factor which encourages the prose-form for all kinds of writing. In such a line as Shelley's:

The wise want power: the powerful goodness want

we can feel only too acutely the kind of syntactical stiffness which tempts a modern poet to write in prose. Moreover, the late Sir Walter Raleigh did well to point out, apropos of Wordsworth's theory of poetic diction, that some of the flattest passages in that poet's own work are due to his having observed the prose choice of words (in accordance with his theory) without at the same time keeping to the natural

¹ V. 3.

[158]
POETIC DICTION

prose order. The meaning of these phrases, the 'prose choice of words' and the 'prose order', implying, as they do, that there is also a poetic choice of words and a poetic order, can be better considered in the next chapter. Meanwhile one may again recall Coleridge's definition of poetry as 'the best words in the best order'.

It is evident, without further examples, that, ceteris paribus, where a rigidly regular metrical framework has to be applied to a language in which grammar is itself growing strict concerning the order in which words may be placed, it must become harder and harder for verse and poetry to keep house together. Nor is it without significance that we, to-day, should be more disgusted by 'inversions' of the kind quoted above, and consequently more afraid of them, than our immediate ancestors; as a glance at contemporary verse will prove beyond dispute.

Thus, if we chose to confine our prophetic gaze to language and its 'progress', we should certainly behold Poetry giving poor Verse a bill of divorce and flying at some distant date into the arms of prose. A study of Chinese literature, in which word-order, as has been pointed out, is already rigidly determinate and

VERSE AND PROSE

of paramount denotative importance, might possibly throw a more comforting light on this prospect—comforting, that is, to those whose ears delight especially in the rhythms and music of verse. But, in any case, if we try to alter the focus of our vision and look upon the art of poetry as a whole, we shall find plenty of contradictory evidence. Such an attempt I cannot very well make, since it is my object to confine this book to that area of Poetry which is related to the intrinsic nature of language. Thus, I ignore altogether such questions as dramatic or architectonic values, quality of personal emotion, etc.; even the element of rhythm can only be discussed in so far as it is found to be inseparable from the use of speech; and I can hardly touch upon the nature of music.

When the individual’s part in the making of poetry has reached a point at which poetry becomes an ‘art’, an entirely new set of forces begins to break through the shell of language proper, forces which tend to increase rather

1 As far, however, as analogies with our own tongue are concerned, it must be remembered that the language of China has apparently remained almost unchanged throughout the whole known period of her history; so that its evolution from a looser, more flexional, form is no more than a hypothesis, albeit a highly convincing one.
POETIC DICTION

than diminish with the further passing of time. These forces are, as we saw, imparted by the individual poet himself; and one of the moulds into which they flow is the music of poetry. Music (if one can use a fraction here) may comprise perhaps as much as half the meaning of a modern lyric. But here I merely wish to point to it as one of the factors which counterbalance the tendency towards the prose form which has just been traced. Music may be distinguished from rhythm by the increasing aesthetic value of sound, as against mere time, and, unlike rhythm, it is not an instinctive element in early speech. As the Aryan languages develop, the quantitative values, which gave a rhythm to some extent inherent in the language itself, decay, while accent, which is much more a determination of the material part of language by the speaker's own peculiar meaning, arises in their stead. Now the decay of the quantitative values leaves us with prose, but, on the other hand, the rise of accent brings us—music. Alliteration and assonance are discovered—both practically unknown¹ to the

VERSE AND PROSE

ancients—and if these are musical devices not wholly peculiar to verse, but open also to poetic prose, yet in rime we are face to face with the development, at a comparatively late date, of an entirely new system of versification.

The significance of rime to the history and making of poetry I consider to be outside the scope of this book; but the mere fact that such a form has come into being, since poetry was an art, may well remind us how much, how very much, is possible to the human imagination, once it has begun to drink, with fuller consciousness, from the primal source of Meaning. It would be pure fantasy to attempt to prescribe in advance what uses man himself shall henceforth make of the material element in language.

¹ Deliberate onomatopoea can safely be distinguished from pure alliteration and assonance, whose end is music before imitation.
ARCHAISM

1. At the beginning of this book it was found that poetic pleasure—the stir of aesthetic imagination—is caused by a change of consciousness from one level to another. And, in what followed, we saw that, while such a change can be brought about by all sorts of means, yet, within the bounds of a study of language itself, the one most constantly operative is the lapse of time. For the natural progress of language, if left, as it were, to itself, is a progress from poetic towards prosaic. It thus tends to bring about conditions suitable for appreciation, such appreciation being no other than when an unconsciously created meaning (the poetic force in language and experience) is realized, or finds itself, in full waking consciousness—which latter state is itself made possible by the prosaic principle. It is not surprising, therefore, to find that the most characteristic phenomena of poetic diction, the most typical differ-

ences between the language of poetry and prosaic language, can be grouped under the heading of Archaism.

‘The language of the age’, wrote Gray, ‘is never the language of poetry, except among the French, whose verse, where the thought or image does not support it, differs in nothing from prose.’ And the late Sir Walter Raleigh went so far as to say that the language of poetry always has ‘a certain archaic flavour’. Indeed, to the average person, the phrase ‘poetic diction’ is probably almost synonymous with what the literary mean by ‘Archaism’. Much that might seem to claim separate treatment will be found, on analysis, to come within reach of this general principle; even the verse-form, for instance, which, though not essential, still remains one of the most constant empirical distinctions between poetry and the prosaic, is, from one point of view, a kind of archaism, as we saw in the last chapter. Again, if we truly understand the normal progress of language, the poet's distaste for ‘abstract’ words and his preference for the ‘concrete’, his distaste for subordination and his love of main sentences, fall equally smoothly into line.

2. Dismissing versification, which has already
POETIC DICTION

received separate treatment, we can divide the ground covered by archaism in poetic diction into two principal parts—Choice of Words, and Grammar. Let us consider the latter first: 'The most subtle form of archaism', says M. Bréal, in his Semantics, 'is to appeal to grammatical methods that no longer exist in the popular consciousness.' Now the epithet 'subtle' here is somewhat restrictive; it suggests the archaism of the delicate scholar who mobilizes all sorts of refined literary associations to tickle the fancies of persons similarly educated, and of those persons only. It suggests, in fact, the allusive style in which Milton excelled, and which is indeed one of the forms of grammatical archaism. Thus, to take the full savour of

Me miserable! which way shall I flee
Infinite wrath, and infinite despair?
Which way I flee is Hell; myself am Hell. . . .

one must be acquainted, not so much with the earlier habit of one's own tongue, as with something more recondite still—a dead language.

But outside this deliberate archaism, consciously aiming at a special effect, there are all those numberless little peculiarities of poetic diction, such as (in English) the use of the

[166]

ARCHAISM

second person singular, verb-endings in -eth and old strong aorists like clomb, drave, etc., or the double negative, which the poet uses instinctively rather than of set purpose, and which, provided the poetic level of his work is sufficiently sustained, will pass practically unnoticed. That this traditional right to archaic expression should have grown up in the poetry of most nations is more than comprehensible, it appears as almost inevitable in the light of the foregoing principles. For we have seen how, in the Aryan group of languages, grammar grows more and more logical, more and more adapted to the concise expression of abstract thought, and, conversely, less fit for the embodiment of meaning which has not yet become abstract, and therefore eludes logical confinement. Thus, a dilemma which is inherent in all poetic expression is intensified for the modern poet by modern grammar.

'Much of our poetry' [wrote the late Henry Bradley] 'is obscure on a first reading, not because the diction is affected or allusive, but because the structure of the language has compelled the poet to choose between the claims of lucidity and those of emphasis or
POETIC DICTION

received separate treatment, we can divide the ground covered by archaism in poetic diction into two principal parts—Choice of Words, and Grammar. Let us consider the latter first: ‘The most subtle form of archaism’, says M. Bréal, in his Semantics, ‘is to appeal to grammatical methods that no longer exist in the popular consciousness.’ Now the epithet ‘subtle’ here is somewhat restrictive; it suggests the archaism of the delicate scholar who mobilizes all sorts of refined literary associations to tickle the fancies of persons similarly educated, and of those persons only. It suggests, in fact, the allusive style in which Milton excelled, and which is indeed one of the forms of grammatical archaism. Thus, to take the full savour of

Me miserable! which way shall I fly
Infinite wraught, and infinite despair!
Which way I fly is Hell; myself am Hell. . .

one must be acquainted, not so much with the earlier habit of one’s own tongue, as with something more recondite still—a dead language.

But outside this deliberate archaism, consciously aiming at a special effect, there are all those numberless little peculiarities of poetic diction, such as (in English) the use of the

grace. There are passages in many English poets which are puzzling even to mature readers, but which if rendered literally into Latin or German would appear quite simple and straightforward.¹

(It should be remembered that in the progress of grammar, traced out in a previous chapter on the lines indicated by Professor Jespersen, English stands at a later stage than German.) And it is very easy to find examples which bear out Dr. Bradley’s contention:

Music, when soft voices die,
Vibrates in the memory;
Odours, when sweet violets sicken,
Live within the sense they quicken.
Rose leaves, when the rose is dead,
Are heap’d for the beloved’s bed;
And so thy thoughts, when thou art gone,
Love itself shall slumber on.

How much would be gained here if either thoughts or love had, as in Latin, an accusative inflexion different in form from the nominative, or if the verb shall had a plural number, so that one could see at a glance which was subject and which object!

¹ The Making of English, p. 73.

ARCHAISM

The English poet (and in varying degrees all modern European poets), faced with this unpleasant necessity of choosing between ‘lucidity’ and ‘emphasis or grace’—which latter is, of course, another name for their proper poetic meaning—are acting perfectly in accord with the nature of language when they look where they do for a mode of expression in which there is more chance of combining the two. For since this hardening, as it were, of grammatical structure is not only noticeable as between one Aryan tongue and another, but is also operative in the biography of a single language, it is inevitable that they should lag behind in their choice of grammatical forms. It was again Henry Bradley who pointed out that ‘the increased precision of modern English, though it is a great gain for the purposes of matter-of-fact statement, is sometimes the reverse of an advantage for the language of emotion and contemplation. Hence we find that our poetry, and our higher literature in general, often returns to the less developed grammar of the Elizabethan age.’¹

And perhaps the most important element of all in this grammatical archaism is the extra

ARCHAISM

The English poet (and in varying degrees all modern European poets), faced with this unpleasant necessity of choosing between 'lucidity' and 'emphasis or grace'—which latter is, of course, another name for their proper poetic meaning—are acting perfectly in accord with the nature of language when they look where they do for a mode of expression in which there is more chance of combining the two. For since this hardening, as it were, of grammatical structure is not only noticeable as between one Aryan tongue and another, but is also operative in the biography of a single language, it is inevitable that they should lag behind in their choice of grammatical forms. It was again Henry Bradley who pointed out that 'the increased precision of modern English, though it is a great gain for the purposes of matter-of-fact statement, is sometimes the reverse of an advantage for the language of emotion and contemplation. Hence we find that our poetry, and our higher literature in general, often returns to the less developed grammar of the Elizabethan age.'¹

And perhaps the most important element of all in this grammatical archaism is the extra

¹ Ibid., p. 73.

[ 169 ]
POETIC DICTION

liberty which the poet retains as to the order in which he shall arrange his words. This has been partly remarked already, and the causes are evident in the evolutionary tendency of speech towards a more and more crystallized, a more and more Chinese, condition. 'Poetry', says M. Bréal, 'has kept the habit of inversions, which are nothing but a licence of ancient days.' What innumerable examples of that familiar licence there are! — inversions which would be unthinkable in prosaic writing, and yet hardly strike the ear at all in poetry — of which, indeed, one is almost astonished to have it pointed out that they are inversions. What, for instance, could sound more simple, straightforward, and modern than

Now sleeps the crimson petal, now the white,?

But though M. Bréal has allowed himself to use the expression 'nothing but', it seems to me that there is another kind of inversion, one which is not simply a licence of ancient days retained instinctively for convenience, but is employed with set purpose to obtain a definite effect. Of such a kind, surely, is Milton's

Teiresias and Phineus, prophets old,
of such a kind par excellence are the extra-

ARCHAISM

ordinary inversions employed to-day with such conspicuous success by Mr. de la Mare:

In mute desire she sways softly;
Thrilling sap up-flows;
She praises God in her beauty and grace,
Whispers delight. And there flows
A delicate wind from the Southern seas,
Kissing her leaves. She sighs.
While the birds in her tresses make merry;
Burns the sun in the skies.

It is fairly clear that the expressive significance of such inversions lies principally in the domain of music and is thus outside our scope. But it may be as well to point out that, while they are not mere archaic licences but, on the contrary, employed for special effects, yet even so they do not seem to be wholly divorced from the ancient habit of the language. To my ear at least there is in the poetry of Mr. de la Mare, especially in his habit of beginning the line with the main verb, a decided echo of the old alliterative measure which our modern metres have replaced — the earliest English verse. Nor is this surprising: the very feet that his rhythms have high poetic value, etc. than now suggest to us that the poet, while, just as have anew, is likely to be in a sense restored, labelled thing old. And if the most ancient before he
of verse are but the sound, dying away, of just those 'footsteps of Nature' whose visible print we have observed, with Bacon, in the present possibility of (true metaphor) we shall hardly be surprised to hear in the music which such a poet creates, albeit spontaneously, something like an echo of just those rhythms.

3. But if there is a difference between the prose order of words and the poetic order, there is also, as we saw, a prosaic and poetic choice of words. And it is here that archaism is often at the same time least conspicuous and most significant. Before considering in greater detail what may determine this poetic choice of words, it will be well to define archaism itself a little more narrowly; for confusion is only too easy, and much that may appear at first sight to be archaic is really nothing of the sort. Thus, the mere confining of oneself to a choice of words, a grammar, or a set of mannerisms which has been for some time and is still in general literary use, is not archaism, though archaism may seem in the long run (and especially in the case of grammar) to involve that. This should merely be called conservatism, or even—not to put too fine a point on it—dullness. And its cause lies, not

[172]

in the nature of language, but in the nature of man, and especially of literary man.

To say that conservatism in poetic diction is due to imitation is not to accuse those minor poets to whom it is due either of insincerity or of the lack of all genuine poetic experience. Charles Lamb, himself a minor poet, when solemnly told that he must 'write for the age', is said to have replied: 'Confound the age! I will write for antiquity!' If so, his gentle humour was giving a sort of intuitively correct expression to a fact in the history of literature. It was stated more exactly by Sir Walter Raleigh, when he said that poets 'learn from other poets'—not from conversation, as the prose-writer so often does. In this sense, Milton was a pupil of Spenser, and Pope and Wordsworth of Milton; but the result is not always as happy as in these cases. For a certain kind of pupil—as though more concerned to please his master than to digest his lesson—insists, as it were, on learning the lesson off by heart. This is the minor poet. The minor poet is appreciator rather than creator. He imitates, because he must have his idiom established, acknowledged, labelled in his own consciousness as 'poetic' before he

[173]
POETIC DICTION

can feel that he is writing poetry. He is always trying to give himself the sensations which he has received from reading the works of greater poets. And, since his energies go more into contemplating than creating, it is even probable that he extracts more aesthetic pleasure from his own work than the great poet does.

A poetic meaning is already in the words and mannerisms which the minor poet is instinctively drawn to use and imitate. Whether it is there as a legacy from the ancient poetic meaning in all language, or whether it is there because it has been put there by some original poet in the past, the fact remains that it is there. It is to do some of my work for me, thinks he (though not, of course, in so many words); let me fit my own emotional experience as neatly as I can into the established poetic moulds, and the result will give me something, will comfort me, intoxicate me.

The great poet, on the contrary, is himself the giver. He is giving out all the time—knowledge to other men, meaning to language. This he does by externalizing as fully as is possible in words his own first-hand experience beyond them. There is, indeed, a certain

ARCHAISM

simplicity and sobriety about the activity of men who expend more energy upon creation than upon appreciation. If they are poets, they do not require to wear their hair long or to neglect their accounts in order to remind themselves of the fact. They are what they are. The difference was well put by Wordsworth:

"The earliest poets of all nations generally wrote from passion excited by real events; they wrote naturally, and as men: feeling powerfully as they did, their language was daring, and figurative. In succeeding times, Poets, and Men ambitious of the fame of Poets, perceiving the influence of such language, and desirous of producing the same effect without being animated by the same passion, set themselves to a mechanical adoption of these figures of speech, and made use of them, sometimes with propriety, but much more frequently applied them to feelings and thoughts with which they had no natural connection whatsoever. A language was thus insensibly produced, differing materially from the real language of men in any situation. The Reader or Hearer of this distorted language found

[174]
POETIC DICTION

himself in a perturbed and unusual state of mind also: in both cases he was willing that his common judgment and understanding should be laid asleep, and he had no instinctive and infallible perception of the true to make him reject the false; the one served as a passport for the other. The emotion was in both cases delightful, and no wonder if he confounded one with the other, and believed them both to be produced by the same, or similar causes. Besides, the Poet spoke to him in the character of a man to be looked up to, a man of genius and authority. Thus, and from a variety of other causes, this distorted language was received with admiration; and Poets, it is probable, who had before contented themselves for the most part with misapplying only expressions which at first had been distorted by real passion, carried the abuse still further, and introduced phrases composed apparently in the spirit of the original figurative language of passion, yet altogether of their own invention, and characterized by various degrees of wanton deviation from good sense and Nature.¹

It is just this conservatism, or mimicry,

¹ Appendix on the phrase, 'Poetic Diction'.

[177]
POETIC DICTION

words could have been used in the same order. Since Wordsworth's acute analysis of the
causes of bad poetry, the phrase 'poetic diction'
has tended to retain its disparaging flavour;
and it was principally for this reason that I
included the words 'obviously intended to
arouse' in the definition which I gave on the
first page of this book.

But soon after such a false 'poetic diction'
has become established as a fashion, it begins
for that reason to destroy itself. The very
word 'fashion' implies change; and the absence
of change and movement which, as we have
seen, are indispensable to the pleasure of
appreciation, now makes itself felt, just as it
did (II, 3) when I read too many ballads at a
sitting. So it comes about (unless there be a
grievous dearth of greater poets) that real
inspiration, the expression of first-hand spiritual
experience, breaks through the shell of poetic
posturings embodied in the fashionable diction
of the moment, and there is a 'Return to
Nature'. An American writer has remarked
of the period between Milton and Wordsworth
that it 'ended in a wholesale abolition of
"Poetic Diction", and a return to the spoken
language'. And then she adds: 'We do not
usually recall that it began in exactly the same
manner'.

There is little doubt that nearly every poetic
fashion (to use a word more in keeping with
the trivial nature of the thing) begins in this
way as a return to Nature, or in other words a
return to the attempted expression of genuine
knowledge. And this return to Nature itself,
this breaking through the shell of the old
poetic fashion, which is clearly the very opposite
of conservatism, may yet be very closely allied
to archaism. True archaism does imply, not a
standing still, but a return to something older,
and if we examine it more closely, we shall find
that it generally means a movement towards
language at an earlier stage of its own develop-
ment. Nothing further, it is hoped, need be
said as to the general reasons why language at
an earlier stage of its own development should
be more suitable for poetic expression, or why
a return in that direction should correspond in
some degree with a return to 'Nature'. That
the two do in fact often go together is palpable
from the history of European literature.

4. Archaism, whether grammatical or selec-

1 M. L. Barstow: Wordsworth's Theory of Poetic Diction,
p. 24.
POETIC DICTION

Revival, with its double passion for minute observation of nature and for grubbing up medieval words—words whose meanings had never been through the eighteenth-century mill of abstraction—is the most obvious example of all of this literary archaism. Beside it must be set the colloquial archaism which employs words and forms in spoken, but not in literary use during its own day. The writer of prose, whose material is prosaic, need never diverge very far from the spoken language; and it has been well pointed out that the habit of good conversation probably had something to do with the growth of that lucid and simple prose style which was the crowning literary glory of the eighteenth century. But since poets, unlike prose-writers, learn more from other poets, and are conservative when they are not great, they are apt to lose touch with the language spoken by their fellow-men. This language, especially among the simple and unsophisticated part of a population, which is kept ‘close to Nature’ by the very necessities of livelihood, is usually representative in some degree of the literary language itself at an earlier stage, and before its meanings had been through that abstracting process.

1 Array, boon, furbished, crown, swayed, smouldering are among the many examples which Gray gives in a letter to R. West (1742). The New English Dictionary, however, has quotations for most of them between Shakespeare and Dryden.
POETIC DICTION

which is both cause and effect of the increased intellectual refinement that now differentiates it from 'vulgar speech'. Where that is not so, and the vulgar locutions to which a poet flies for life have a late origin—as, for example, in the case of some slang phrases—it is still not wholly unreasonable to use the word 'archaism', since this part of the language is clearly younger than the other, that is to say, it is nearer to its own source. For properly understood, archaism chooses, not old words, but young ones. If it is objected that the meaning of archaism is here stretched too far, the reply, of course, is that it is only by such deliberate extensions that hitherto unapprehended, or unemphasized, relationships can become incarnate in meaning.

Of such a nature was the colloquial archaism of Dante, and indeed of all those European poets who first abandoned Latin for their native tongues. Just as it was conservatism which retained Latin for so long as the literary language of Europe, so we may call it archaism which at last saw and welcomed the poetic value, the freshness, the touch of Nature, without which there can be no true knowledge, in the young idiom of Romance and

ARCHAISM

the barbarous dissonance of the Northern races.

In France, Ronsard and Du Bellay seem to have combined both kinds of archaism, while Malherbe in the seventeenth century pressed the colloquial variety with such good will that he well-nigh abolished for his native country the whole distinction between a prosaic language and a language of poetry. Consequently, during the eighteenth century, it was difficult for a French writer to be either very poetic or very prosaic. The best French verse represents an essentially prosaic idiom carried as near the poetic as it will go. It tends to be of the kind

1 Compare the quotation from Gray's letter in § 1 of this chapter.

It is significant of the state at which the literary language had arrived in England at about the same time (i.e. before the particular 'return to Nature' which culminated in the diction of Pope and his followers) that the Royal Society itself should have turned for clarity to the language of 'artisans, countrypen, and merchants'. The fact suggests, moreover, that the now somewhat rapidly growing divergence between the meanings of the two words science and knowledge ought not to be laid to the charge of the original and poetic founders of that far-reaching institution.

[182]

[183]
POETIC DICTION

depicted in VII, 6, in which the poet actually assists, instead of opposing, the normal ‘progress’ of language. But in English literature, while all the great poets have instinctively employed more or less of this colloquial archaism, there was nothing of that deliberate and systematic nature which distinguishes Italian and French literary history, until the time of Wordsworth.¹

These great movements of archaism, which are at the same time returns to Nature, are only inaugurated, as we should expect, by the greater poets. They are led by poets with something to say, in other words, with something to give. It is these who break away from the old ‘poetic diction’ in its futile sense, and it is not their fault that what they create eventually becomes a new one. At first, indeed, so far from being the fashion, their language is likely to find it difficult to get a hearing at all. For the critic, like the minor poet (they are often one even in corporeal substance) needs to have his poetry in an idiom already duly established as poetry, before he can appreciate it as such. And, usually, nothing but time can bring this about; as the new style percolates through the more lively and original spirits till at last it receives the franchise of the pedants and the literary snobs. Thus, it so often comes about that the fame of great poets is posthumous only. They have, as Shelley said, to create the taste by which they are appreciated; and by the time they have done so, the choice of words, the new meaning and manner of speech which they have brought in must, by the nature of things, be itself growing heavier and heavier, hanging like a millstone of authority round the neck of free expression. We have but to substitute dogma for literature, and we find the same endless antagonism between prophet and priest. How shall the hard rind not hate and detest the unembodied life that is cracking it from within? How shall the mother not feel pain?

¹ In our own day we have been witnessing the success over a smaller area of the dramatist, J. M. Synge.
STRANGENESS

1. The question has often been raised whether or no poets make good critics. Is it an advantage, it is asked, that the critic should himself be creative? Those who hold that it is not, point out that the powerful imagination of a poet may easily be stimulated by some experience of which the artistic ingredients are in themselves trivial, or non-existent, so that the poet-critic may mistake his own poetic contribution for that of the original author. 'Tipperary' on a barrel organ may move him more than the Ninth Symphony; let him beware, therefore, of expressing an opinion on music. On the other hand, really dreadful pitfalls open at the feet of the unpoeitic critic. For, since his principal function is appreciation, it follows that the prosaic—the death-forces—are particularly strong in him. Therefore, if his endless appraisals are not leavened by some creative vigour of his own, he is in danger of losing all sympathy with the Poetic itself, that bodiless ocean of life out of which all works of art spring. Nay, he may even cease to believe in it. For the pure prosaic can apprehend nothing but results. It knows nought of the thing coming into being, only of the thing become. It cannot realize shapes. It sees nature—and would like to see art—as a series of mechanical rearrangements of objects.

Consequently the non-creative critic can never be the interpreter proper (VIII, 4); he can only be the collector. As time passes and the dammed springs of poetic impulse which first impelled him to criticism dry up, his criticism becomes no more than a hunting for subtle sensations and high flavours, and then a nice classification of these according to similar sensations and flavours enjoyed in the past. He invents proper epithets like Dantean, Dickensian, Shavian, to save himself the trouble of interpretation; and these become less and less significant as they are drawn from more and more minor artists; till at last his work tells us nothing about its subject-matter and too much about its author.

It may, however, be asked why an interpreter should be necessary or desirable. The
POETIC DICTION

answer to this lies in the nature of inspiration. And it should be apparent that, the more perfectly balanced are the two principles in the poet himself, the more control he has of his inspiration, the less necessary an interpreter becomes. The perfect poet would express himself perfectly. It is for those writers in whom the rational is too weak for the poetic, whose critical consciousness is dimmed therefore by their inspiration, that we need an interpreter. Such writers may be compared to the seers that most communities revere before they have reached the period of balance between the two principles, and while their poetic—unindividualized—still predominates. Thus, Plato points out in the Timaeus that the seers need 'prophetae' to interpret their meaning. 'For no one', he says, 'attains to true and inspired consciousness while in full possession of his wits, but either the power of his intellect is restricted in sleep, or it is changed by some disease or divine possession.' And he adds that the task of remembering the vision, whether it be a waking or a sleeping one, and of understanding it, is reserved for reason and the full consciousness. The seer himself, on the other hand, while he is still 'raving' and remains in

STRANGENESS

the inspiration, cannot judge of his own vision and words.

This inability to judge and to express himself, however, is not a virtue in a modern poet. Poetry, in our time, implies expression, and therefore judgment. For us, the perfect poet is also the perfect critic. There remains nevertheless the critical interpretation of imperfect poetry; there is still plenty of work for the genuine critic. A controlled and fundamentally sane consciousness, a gentle, sympathetic, imaginative understanding, not only of 'human nature' in the ordinary sense, but of the nature of inspiration and of its function in human evolution—these are the proper equipment of the serious critic; these are the first weapons he must use in his difficult task of distinguishing the true poetic from the merely aesthetic—or, in looser speech, great poetry from poetry. And in doing so he will be confronted with the problem of strangeness.

2. A few further remarks are required on the fact, noted at the beginning of this book, that almost any kind of 'strangeness' may produce an aesthetic effect, that is to say, an effect which, however slight, is qualitatively the same as that of serious poetry. On examination, the

[189]
POETIC DICTION

sole condition is found to be this, that the strangeness shall have an interior significance; it must be felt as arising from a different plane or mode of consciousness, and not merely as eccentricity of expression. It must be a strangeness of meaning. Thus, if I invent the meaningless word, hexterabonto, and insert it in a line of verse, it can add nothing (outside of its sound value) to the aesthetic effect.

Moreover, this outlandishness is, as we have seen, the part of poetry with which the actual pleasure of appreciation—the old, authentic thrill, which is so strong that it binds some men to their libraries for a lifetime, and actually hinders them from increasing knowledge—is most closely connected. This is that 'element of strangeness in all beauty' which has been remarked in one way or another by so many critics. Alike in the greatest poetry and in the least, if pleasure is to arise, it must be there. And conversely, where it is, there will be some aesthetic pleasure. Thus, in Example 1 we saw how even the laughable semantic struggles of Pidgin English have their æsthetic value; nor is this simpler kind of strangeness by any means only to be found in the Southern Hemisphere. Aristotle in his Poetics showed that he knew

STRANGENESS

the æsthetic value of 'unfamiliar' words, among which he included 'foreign expressions'; in keeping diction above the 'ordinary' level; and anyone who has been to the trouble of learning a foreign language after the age at which he has reached a certain degree of æsthetic maturity, will know that æsthetic pleasure arises from the contemplation of quite ordinary expressions couched in a foreign idiom. It is important, then, to note that this is not, in so far as it is æsthetic, the pleasure of comparing different ways of saying the same thing, but the pleasure of realizing the slightly different thing that is said. For, outside the purest abstractions and technicalities, no two languages can ever say quite the same thing.

3. A certain foreign element, impinging on the native genius, has, in point of fact, played a fairly prominent part in the history of English poetry. Who can say how much of the delicious freshness and perfume that hangs about Chaucer's loveliest lines is due to the presence of all those French words, many of them employed in English for the first time in the passage we are reading, and nearly all of them comparatively new to the language? And if

1 ἕνιον λόγον.  2 γλώσσα.  3 ιδιωτικόν.
no other English poet had the same magnificent opportunity of actually borrowing strange words, yet, over and over again, the foreign element has been strong enough to make itself felt idiomatically against a background formed by the genius of our own language. Gray, in a letter to Wharton, actually distinguishes two French and three Italian ‘schools’ between his own day and Chaucer’s; and it is significant that (especially up to the Elizabethan period) so much of our poetry should have consisted of translations from the French, which are not infrequently better than their originals!

4. There are many other examples of this semi-accidental kind of strangeness, among which might be placed various words accepted for centuries past—not apparently because they are older, nor indeed for any discernible reason—as poetic in contradistinction to a parallel prosaic word for almost the same thing. Slumber, bale, dire, billow occur readily to the mind, and there are numberless other examples. Often we find that such words have also continued to survive in dialect use. One wonders, therefore, if their poetic imprimitur may not in some cases have been given them by purely

1 April 15,
POETIC DICTION
this effect even in the titles of his poems, *The Collar, The Pulley, The Bag*, etc., being all names of lyrics whose real, immediate subject is the mystical union of God and man. Wordsworth produces a similar atmosphere in the following beautiful quatrains from *The Reverie of Poor Susan*:

'Tis a note of enchantment; what ails her? She sees
A mountain ascending, a vision of trees;
Bright volumes of vapour through Lothbury glide,
And a river flows on through the vale of Cheapside.

And in our own day Mr. G. K. Chesterton, both in prose and verse, is a past master of this particular effect, which might be described as the art of concentrating attention on a familiar thing by making it stand out suddenly from an unfamiliar background.

This device affects the soul in a manner which is perhaps most adequately expressed by the French verb *frapper*. A similar effect is obtained by slightly different means in the use of words which are *technical* in the stricter sense, as being part of the jargon of a special art or trade. Malherbe, who said that he used the language of ‘crocheteurs’, qualified his statement by adding ‘only so far as it is generally intelligible’; but Dryden, scorning such a

STRANGENESS
negative system of selection, boasted that he was ‘not ashamed to learn something about language from sailors’. Nor was navigation the only trade whose vocabulary appealed to him in this way; few people to-day would deny the fine effect of the lines from *St. Cecilia’s Day*:

From harmony, from heavenly harmony,
This universal frame began:
From harmony to harmony
Through all the compass of the notes it ran,
The diapason closing full in Man.

Johnson, however, censured Dryden for the use of such a technical term as *diapason* on the ground that ‘all appropriated terms of art should be sunk in general expressions, because poetry is to speak a general language’.

Here we must gently but firmly insist that the Great Cham was hopelessly wrong—unless by ‘general’ he merely meant ‘intelligible’. For if there is anything besides their strangeness which might commend these technical words to a poet, it would be just the fact that they are *not* general. They express, as nearly as any word can do, a concrete, particular *thing*, and not an abstract, generalized *idea*. The theory of this has already been

[194]
POETIC DICTION

partly discussed and will be developed farther in an Appendix; but it may be worth pointing out here an instinctive tendency in poets, and others, to use general terms of things which they are ignorant of or despise, or in which they can discern no poetic value, and particular—even technical—terms of things which really inspire them. Love is the begetter of intimate knowledge; for what we love it is not tedious, but delightful, to observe minutely. Wordsworth’s ‘itinerant vehicle’ has already been quoted: one thinks of what Dickens could make, alike of that same conveyance and of the dinner-table which to Wordsworth is only the ‘social board’. Pope, on the other hand, will generalize the meadows which Wordsworth never tires of describing in lovingest detail, under some such phrase as ‘flowery mead’, while the contents of Belinda’s toilet-table receive from his pen their proper names.

All this, however, is somewhat of a digression, since the point here is, not the value of appropriate or technical words in their own sphere, but their effectiveness when carried outside it.

1 Hatred, as in the case of satire, or any powerful feeling, may lead to a similar result. It is really indifference, alone, which accepts generalization as sufficient.

[196]

STRANGENESS

It is the outsider, not the habitué, who appreciates the poetic value of the technical terms and peculiar idiom of a science, an art, or a trade—a value, be it said, which is often exceedingly high. No genuine lover of poetry and of words can pick up a book on, say, Botany or Metallurgy, and read of spores and capsules and lanceolate leaves, of pearly and adamantine lustres, without feeling poetically enriched by that section of the new vocabulary which actually impinges on his own present consciousness of Nature. Nor can he even listen to a circle of enthusiasts—sailors, golfers, wireless men, actors, and the like—riding, as they do, their special hobby-horses idiomatically over all departments of life, without being delighted, without being frappé (for a short time only) by the result.

6. At the risk of tedious repetition, I would insist once more that this aesthetic value of strangeness overlaps, but does not coincide with, the ancient and proverbial truism that familiarity breeds contempt. It is not synonymous with wonder; for wonder is our reaction to things which we are conscious of not quite understanding, or at any rate of understanding less than we had thought. The
POETIC DICTION

element of strangeness in beauty has the contrary effect. It arises from contact with a different kind of consciousness from our own, different, yet not so remote that we cannot partly share it, as indeed, in such a connexion, the mere word 'contact' implies. Strangeness, in fact, arouses wonder when we do not understand; aesthetic imagination when we do.

[198]

CONCLUSION

1. The various instances of strangeness which have just been cited were of a somewhat accidental and trivial nature. But there is, as we have seen, one kind which is not accidental at all, and which, irrespective of these others, can always be produced where a creative imagination is wedded to an acute intellect. In very strict speech I think it should be distinguished, as the truly poetic, from the other, merely aesthetic, varieties of strangeness. This kind depends, not so much upon the difference between two kinds of consciousness or outlook, as on the act of becoming conscious itself. It is the momentary apprehension of the poetic by the rational, into which the former is forever transmuting itself—which it is itself forever in process of becoming. This is what I would call pure poetry. This is the very moonlight of our experience, true and ever-
POETIC DICTION

recurring begetter of strangeness; it is the pure idea of strangeness, to which all the others are but imperfect approximations, tainted with personal accidents. It is this which gives to great poetry its 'inevitability', distinguishing it from the thousands of delicious trifles that are commonly allowed to be poetic without being great—trifles which, in precise moments, I would only allow to be 'aesthetic'. And since Mind existed, as Life, and Meaning, before it became conscious of itself, as knowledge, not only the activity of great poets, but mere lapse of time may sometimes be a sufficient cause of this archetypal strangeness.

2. The Meaning of life is continually being dried up, as it were, and left for dead in the human mind by the operation of a purely discursive intellectual activity, of which language—builted, as it is, on the impact of sense-perceptions—is the necessary tool. This discursive activity is inseparable from human self-consciousness, out of which it would kill, alike the given Meanings of which language, at its early stages, still retains an echo, and the meanings which individual poets have inserted into it later by their creative activity in metaphor. 'Language', wrote Emerson, in

CONCLUSION

a flash of insight which covers practically all that has been written in these pages, 'is fossil poetry.'

Living poetry, on the other hand—the present stir of aesthetic imagination—lights up only when the normal continuum of this process is interrupted in such a manner that a kind of gap is created, and an earlier impinges directly upon a later—a more living upon a more conscious. This is the justification of archaism; and to a consideration of the more technical kind of archaism, such as was attempted above, a poetic history of language would have to add some account of the part played in, for instance, English literature by revivals of older modes of consciousness as a whole. It would approach from this point of view the Renaissance and the Romantic Revival, and again, the work of individual poets, such as Keats, whose poetic character is almost inseparable from the impact on his modern imagination of the ancient world of Greek myth. It might well go on to consider the re-emergence at intervals of certain particular streams of living meaning, such as that contained in Greek myth itself—Platonism—Esoteric Christianity—and the way in which poetry has blossomed afresh
and in different places, every time they have broken through.

3. The many critics—among them Johnson and Coleridge—who have insisted that the principal object of poetry is to arouse pleasure, were no doubt partly goaded into this opinion by their reaction against a superficially didactic view. But there remains nevertheless a deep truth in their contention. If not the prime object, pleasure is undoubtedly an excellent test, or mark, of the presence of poetry. For what is absolutely necessary to the present existence of poetry? Movement. The wisdom which she has imparted may remain for a time at rest, but she herself will always be found to have gone forward to where there is life, and therefore movement, now. And we have seen that the experience of aesthetic pleasure betrays the real presence of movement, even though its cause be accidental, even though we ourselves have brought about the conditions for it by pretending to forget what we are and know.

But without the continued existence of poetry, without a steady influx of new meaning into language, even the knowledge and wisdom which poetry herself has given in the past must wither away into a species of mechanical calculation. Great poetry is the progressive incarnation of life in consciousness. Hence the absolute value of aesthetic pleasure as a criterion; for before we can feel it, we must have become aware in some degree of the actual progress—not merely of its results. Over the perpetual evolution of human consciousness, which is stamping itself upon the transformation of language, the spirit of poetry hovers, for ever unable to alight. It is only when we are lifted above that transformation, so that we behold it as present movement, that our startled souls feel the little pat and the throbbing, feathery warmth, which tell us that she has perched. It is only when we have risen from beholding the creature into beholding creation that our mortality catches for a moment the music of the turning spheres.
